About

The *International Journal of Applied Mathematics and Computer Science* is a quarterly published jointly by the University of Zielona Góra and the Lubuskie Scientific Society in Zielona Góra, Poland, since 1991. It strives to meet the demand for the presentation of interdisciplinary research in various fields related to control theory, applied mathematics, scientific computing, and computer science.

In particular, AMCS publishes high quality original research results in the following areas: *modern control theory and practice, artificial intelligence methods and their applications, applied mathematics and mathematical optimisation techniques, and mathematical methods in engineering, computer science and biology.*

Chief indexing and abstracting services

ACM Digital Library, Applied Mechanics Reviews, Current Mathematical Publications (AMS), DBLP Computer Science Bibliography, EBSCO, Elsevier, Google Scholar, Inspec, Mathematical Reviews (MathSciNet), Proquest, Thomson Reuters, Zentralblatt MATH, and others.

Impact Factor

1.390 (2013), 1.008 (2012), 0.487 (2011), 0.794 (2010), 0.684 (2009)
5-Year IF: 1.317 (2013), 1.146 (2012)

AIMS & SCOPE

The *International Journal of Applied Mathematics and Computer Science* strives to meet the demand for the presentation of interdisciplinary research in various fields related to control theory, applied mathematics, scientific computing, and computer science. In particular, it publishes high quality original research results in the following areas:

- modern control theory and practice
- artificial intelligence methods and their applications
- applied mathematics and mathematical optimisation techniques
- mathematical methods in engineering, computer science, and biology.

We are primarily interested in presenting theoretical and application-oriented papers dealing with the following topics:

- control theory, including optimal control, system identification, adaptive and robust control, multivariable control, and non-linear systems
- dynamical systems, including spatiotemporal processes, control problems, state and parameter estimation, and sensor networks
- fault detection and diagnosis, including model-based approaches, observers, and classifiers
- fault-tolerant control, including the control of continuous-variable and quantised systems
- robotics, including modelling and simulation, mobile robots, and optimal trajectory planning
- mathematical modelling and simulation, including numerical algorithms
- optimisation, including mathematical optimisation techniques, global optimisation, and evolutionary algorithms
- classification and pattern recognition
- artificial intelligence, including neural networks, knowledge engineering, reasoning and learning models, expert and decision support systems, fuzzy systems, and search methods
- mathematical biology
- applications in engineering and medicine.

The editors welcome proposals for exchange between similar journals. Also, all persons interested in bringing out special issues of *AMCS* are encouraged to contact the Editor-in-Chief. Such issues may be published on any important and timely subject within the scope of the journal. All papers proposed for specials should be refereed and meet the same criteria for scientific quality as articles presented in regular issues.

The publication of *AMCS* is financially supported by the Ministry of Science and Higher Education in Poland and the University of Zielona Góra.

For more information, visit our website at www.amcs.uz.zgora.pl.

PREFACE

Special issue on *Safety, Fault Diagnosis and Fault Tolerant Control in Aerospace Systems*

Modern technological and safety-critical systems rely on sophisticated control solutions to meet increased performance in faulty conditions, reliability and safety requirements. A conventional feedback control design for a complex system may result in an unsatisfactory performance, or even instability, in the event of malfunctions in actuators, sensors or other system components. To overcome this limitation, new approaches to control system design have been developed in order to tolerate component malfunctions while maintaining desirable stability and performance properties. This feature is particularly important for safety-critical systems, such as aircraft and spacecraft. In such plants, the consequences of a minor (abrupt or incipient) fault in a system component can be catastrophic. Therefore, the demand on reliability, safety, availability and fault tolerance is generally high. It is necessary to design control strategies that are capable of tolerating potential faults in order to improve the reliability, safety and availability, while providing desirable performances. These types of control systems are known as fault tolerant control systems. Particularly, they consist of control systems possessing the ability to automatically accommodate component faults. They are also capable of maintaining overall system stability and acceptable performance in the event of such faults. In other words, a closed-loop control system that can tolerate component malfunctions while maintaining desirable performance and stability properties is considered to be a fault tolerant control system.

On the other hand, over the last four decades, the growing demand for safety, reliability, maintainability, and survivability in technical systems has generated significant research in fault detection and diagnosis, resulting in the development of many solutions. Note that, in the literature, fault detection and isolation or fault detection and identification (estimation) are often used. In fault tolerant control system designs, fault identification (i.e., estimation) is important. Therefore the fault detection and diagnosis tasks are mainly considered to highlight the requirement of fault reconstruction. On a parallel path, research on reconfigurable fault tolerant control systems has increased progressively since the initial research on restructurable control and self-repairing flight control systems started in the early 1970s. More recently, fault tolerant control has attracted more and more attention in both industry and academic communities due to increased demands for safety, high system performance, productivity and operating efficiency in a wider engineering application, not limited to traditional safety-critical systems.

Since the 1980s, several milestones have been presented in the literature. In particular, apart from the triennial IFAC Symposium on *Fault Detection, Supervision and Safety for Technical Process (SAFEPROCESS)* started in 1991, in 2010 the first International Conference on *Control and Fault-Tolerant Systems (Systol 2010)* was a success and demonstrated the demand for establishing a permanent scientific forum in the general area of system monitoring, fault diagnosis and fault tolerant control. The second conference on *Control and Fault Tolerant Systems (Systol 2013)*, through its technical program, provided a unique opportunity for the academic and industrial community to formulate new challenges, share solutions and discuss future research directions. Presentations of theoretical results accompanied by practice-related experiments were encouraged, and the best contributions have been selected for this special issue.

Historically, from the point of view of practical application, a significant amount of research on fault tolerant control systems was motivated by aircraft flight control system designs. The key point was to provide fault accommodation features to ensure a safe flight in the event of severe faults in the aircraft. Such effort was also stimulated partly by two commercial aircraft accidents in the late 1970s, involving Delta Flight 1080 (April 12, 1977) and American Airlines DC-10. It is thus evident why the fault tolerant control problem began to draw more and more attention in a wider range of academic and application communities, due to increased safety and reliability demands beyond what a conventional control system can offer. Therefore, the most obvious applications include aerospace and aircraft industries.

This special issue highlights that, maybe due to historical reasons and the complexity of the problem, most of the research on fault diagnosis and fault tolerant control was carried out as two separate tasks. More specifically, many fault diagnosis techniques are developed as a diagnostic or monitoring tool, rather than an integral part of fault tolerant control. As a result, some existing fault detection methods may not satisfy the need of controller reconfiguration. On the other hand, most of the research on reconfigurable controls is carried out assuming the availability of a perfect fault diagnosis. Little attention has been paid to the analysis and design with the overall system structure and interaction between fault diagnosis and fault tolerant control. From the viewpoint of fault tolerant control design, what are the needs and requirements for fault

diagnosis? How to design the fault diagnosis and fault tolerant control in an integrated manner for on-line and real-time applications?

Many challenging topics, which are analysed by the contributions to this special issue properly selected from the *Systol 2013* conference, still remain open for further research and development. One of the motivations of this special issue is to provide an overview on the recent developments in fault tolerant control systems, with application to aerospace systems. At the same time, this publication aims at presenting some challenging open problems for future research. It is the authors' hope that this special issue could provide some useful information to researchers and practitioners in the field in order to facilitate further development of this important area.

Silvio Simani

Department of Engineering
University of Ferrara, Italy

Paolo Castaldi

Department of Electric Energy and Information Engineering
University of Bologna, Italy

March 2015

Silvio Simani was born in Ferrara in 1971. He received the "Laurea" degree (*cum laude*) in electrical engineering in 1996 from the Department of Engineering at the University of Ferrara (Italy), and the Ph.D. in information science (automatic control) at the Universities of Ferrara and Modena (Italy) in 2000. Since 2006 he is an IEEE Senior Member, and since 2000 a member of the SAFEPROCESS Technical Committee. Since 2002 he has been as assistant professor at the Department of Engineering of Ferrara. His research interests include fault diagnosis and fault tolerant control, and system identification. He is author of about 160 refereed journal and conference papers, several book chapters, as well as three books on these topics.

Paolo Castaldi received the "Laurea" degree (*cum laude*) in electronic engineering in 1990 and the Ph.D degree in system engineering in 1994. Since 1995 he has been an assistant professor at the Department of Electrical, Electronic and Information Engineering of the University of Bologna. Since 2009 he has been a member of the IFAC Technical Committee on Aerospace. His research interests include fault diagnosis and fault tolerant control, adaptive filtering, system identification, and their applications to aerospace and mechanical systems. He has published about 100 refereed journal and conference papers, several book chapters, and one monograph on these topics. Moreover, he is a pilot with the ultralight aircraft licence.

Requirements in brief

Our basic rules include electronic paper submission and processing, the LaTeX format following a special AMCS style, a license to publish, and page charges.

Paper submission

Paper proposals may be submitted only through our on-line submission system. If suitable for our journal, the papers will be subject to a full review procedure, and a decision on whether or not to accept the paper will be made based on the reviewers' comments.

Paper style

The style of papers to be published in AMCS is determined by a special LaTeX class, which is described in detail in our instructions for authors. No other formats are accepted.

License to publish

Currently, all authors must sign the license to publish upon paper acceptance. The license governs in detail the commercial and non-commercial use of papers published by our journal, and determines user and author rights.

Page charge

As of 2015, authors are expected to pay page charges, which cover the costs of the publishing process and will be invoiced upon paper acceptance.

Provisions

One sample copy of the journal and the electronic version of the paper are provided for authors once the issue has been published.

Details, submission and downloads

The complete guide for authors can be found on our website at www.amcs.uz.zgora.pl.
