22 **Abstract**

23 Ibuprofen is a widely used non-steroidal anti-inflammatory drug (NSAID) that
24 exerts analgesic and anti-inflammatory actions. The transient receptor potential ankyrin
25 1 (TRPA1) channel, expressed primarily in nociceptors, mediates the action of proalgesic
26 and inflammatory agents. Ibuprofen metabolism yields the reactive compound,
27 ibuprofen-acyl glucuronide, which, like other TRPA1 ligands, covalently interacts with
28 macromolecules. To explore whether ibuprofen-acyl glucuronide contributes to the
29 ibuprofen analgesic and anti-inflammatory actions by targeting TRPA1, we used *in vitro*
30 tools (TRPA1-expressing human and rodent cells) and *in vivo* mouse models of
31 inflammatory pain. Ibuprofen-acyl glucuronide, but not ibuprofen, inhibited calcium
32 responses evoked by reactive TRPA1 agonists, including allyl isothiocyanate (AITC), in
33 cells expressing the recombinant and native human channel and in cultured rat primary
34 sensory neurons. Responses by the non-reactive agonist, menthol, in a mutant human
35 TRPA1 lacking key cysteine-lysine residues, were not affected. In addition, molecular
36 modeling studies evaluating the covalent interaction of ibuprofen-acyl glucuronide with
37 TRPA1 suggested the key cysteine residue C621 as a probable alkylation site for the
38 ligand. Local administration of ibuprofen-acyl glucuronide, but not ibuprofen, in the
39 mouse hind paw attenuated nociception by AITC and other TRPA1 agonists and the early
40 nociceptive response (phase I) to formalin. Systemic ibuprofen-acyl glucuronide and
41 ibuprofen, but not indomethacin, reduced phase I of the formalin response. Carrageenan-
42 evoked allodynia in mice was reduced by local ibuprofen-acyl glucuronide, but not by
43 ibuprofen, whereas both drugs attenuated PGE₂ levels. Ibuprofen-acyl glucuronide, but
44 not ibuprofen, inhibited the release of IL-8 evoked by AITC from cultured bronchial
45 epithelial cells. The reactive ibuprofen metabolite selectively antagonizes TRPA1,

46 suggesting that this novel action of ibuprofen-acyl glucuronide might contribute to the
47 analgesic and anti-inflammatory activities of the parent drug.

48

49 **Abbreviations**

50 AITC, allyl isothiocyanate; IAG, ibuprofen-acyl glucuronide; ANOVA, analysis of
51 variance; COX, cyclooxygenase; DRG, dorsal root ganglia; DMEM, Dulbecco's modified
52 Eagle's medium; DMSO, dimethyl sulfoxide; FBS, fetal bovine serum; H₂O₂, hydrogen
53 peroxide; HBSS, Hank's balanced salt solution; HEK, human embryonic kidney cells;
54 NSAID, non-steroidal anti-inflammatory drug; PG, prostaglandin; PAR-2, proteinase
55 activated receptor 2; PAR2-AP, activating peptide of the PAR-2 receptor; ROS, reactive
56 oxygen species; RNS, reactive nitrogen species; RCS, reactive carbonyl species; TRPA1,
57 transient receptor potential ankyrin 1; TRPV1, transient receptor potential vanilloid 1;
58 TRPV4, transient receptor potential vanilloid 4; ZnCl₂, zinc chloride.

59

60 **1. Introduction**

61 Ibuprofen, the first approved member of propionic acid derivatives, is a classical
62 non-steroidal anti-inflammatory drug (NSAID) widely used for its analgesic and anti-
63 inflammatory properties (1, 2). Ibuprofen is indicated to relieve inflammation and several
64 types of pain, including headache, muscular pain, toothache, backache, and dysmenorrhea
65 (2). Therapeutic effects of ibuprofen are attributed to inhibition of prostanoid synthesis
66 by a non-selective, reversible inhibition of both cyclooxygenase 1 (COX1) and 2 (COX2)
67 (3, 4).

68 The transient receptor potential ankyrin 1 (TRPA1), coexpressed with the TRP
69 vanilloid 1 (TRPV1) in a subpopulation of primary sensory neurons, is activated by
70 exogenous compounds, such as allyl isothiocyanate (AITC) and cinnamaldehyde (5), and
71 by an unprecedented series of reactive oxidative, nitrogen and carbonylative species
72 (ROS, RNS and RCS, respectively), including hydrogen peroxide (H₂O₂) and the
73 electrophilic α,β -unsaturated aldehydes, 4-hydroxynonenal and acrolein (6-10). Such
74 compounds, *via* Michael addition or oxidation reactions, covalently bind specific
75 cysteine/lysine residues of the cytoplasmic amino-terminus (11, 12), thus gating the
76 channel. TRPA1 has been proposed as a major pain transducer (13-15), because of its
77 implication in models of both inflammatory pain, including those evoked by formalin
78 (16) and carrageenan (17, 18), and neuropathic pain, such as those induced by nerve injury
79 (19-21), or anticancer drugs (22, 23). **Clinical interest for the therapeutic potential of**
80 **TRPA1 blockade is underlined by current clinical trials with TRPA1 antagonists (24).**
81 Expression of TRPA1 is not limited to primary sensory neurons, as its presence and
82 functions have been documented in a variety of non-neuronal cells, including some cells

83 of the airway tissues, where its activation evokes the release of proinflammatory
84 cytokines, such as interleukin-8 (25-27).

85 Ibuprofen is almost completely metabolized, *via* an oxidative reaction to the
86 inactive metabolites, carboxy-ibuprofen and 2-hydroxy-ibuprofen, which are both
87 eliminated in the urine (28, 29). However, 10-15% of ibuprofen is glucuronidated to
88 ibuprofen-acyl glucuronide (28). Plasma levels of ibuprofen and ibuprofen-acyl
89 glucuronide have been assessed in patients receiving long-term administration of oral
90 doses of 600/800 mg ibuprofen. The ibuprofen and ibuprofen-acyl glucuronide ratio was
91 ~30 to 1, (30). Although glucuronidation is generally considered a detoxification
92 pathway, acyl glucuronides undergo molecular rearrangement to reactive metabolites,
93 which may covalently bind various macromolecules (30, 31). Therefore, we investigated
94 whether ibuprofen-acyl glucuronide antagonizes TRPA1 and, *via* this mechanism,
95 contributes to the analgesic and anti-inflammatory actions of ibuprofen. We found that
96 ibuprofen-acyl glucuronide, but not ibuprofen, attenuates excitatory and pro-
97 inflammatory responses in TRPA1-expressing cells *in vitro* and proalgesic responses *in*
98 *vivo* elicited by reactive agonists of the channel. Ibuprofen-acyl glucuronide also
99 selectively attenuated the TRPA1-dependent component of the proalgesic responses
100 evoked *in vivo* by formalin or carrageenan, thus underlying the hypothesis that TRPA1
101 targeting by ibuprofen-acyl glucuronide contributes to both analgesic and anti-
102 inflammatory effects of ibuprofen.

103 **2. Materials and Methods**

104 **2.1. Animals**

105 *In vivo* experiments and tissue collection were carried out according to European
106 Union (EU) guidelines and Italian legislation (DLgs 26/2014, EU Directive application
107 2010/63/EU) for animal care procedures, and under the University of Florence research
108 permit #194/2015-PR. C57BL/6J mice (male, 20-22 g, 6 weeks; Envigo, Milan, Italy);
109 TRPA1-deficient (*Trpa1*^{-/-}) mice (25-30 g, 5-8 weeks) (32) or Sprague-Dawley rats
110 (male, 75-100 g, Envigo, Milan, Italy) were used. Animals were housed in a temperature-
111 and humidity-controlled *vivarium* (12-hour dark/light cycle, free access to food and
112 water). Animal studies were reported in compliance with the ARRIVE guidelines (33).

113 Group size of n=6 animals for behavioral experiments were determined by sample
114 size estimation using G*Power (v3.1) (34) to detect size effect in a post-hoc test with type
115 1 and 2 error rates of 5 and 20%, respectively. Allocation concealment was performed
116 using a randomization procedure (<http://www.randomizer.org/>). Experiments were done
117 in a quiet, temperature-controlled (20 to 22 °C) room between 9 a.m. and 5 p.m. and were
118 performed by an operator blinded to drug treatment. Animals were euthanized with
119 inhaled CO₂ plus 10-50% O₂. For the *in vitro* experiments we used a total of 10 rats and
120 42 mice.

121

122 **2.2. Reagents and Cells**

123 HC-030031 [2-(1,3-dimethyl-2,6-dioxo-1,2,3,6-tetrahydro-7H-purin-7-yl)-N-(4-
124 isopropylphenyl) acetamide] was synthesized as previously described (35). If not
125 otherwise indicated, reagents were obtained from Sigma-Aldrich (Milan, Italy). Human
126 embryonic kidney 293 (hHEK293, American Type Culture Collection; ATCC® CRL-

127 1573™) cells, HEK293 cells stably transfected with cDNA for human TRPA1 (hTRPA1-
128 HEK293), or with the cDNA for human TRPV1 (hTRPV1-HEK293), or with the cDNA
129 for human TRPV4 (hTRPV4-HEK293), or with cDNA for both human TRPA1 and
130 human TRPV1 (hTRPA1/V1-HEK293) channels, were cultured as previously described
131 (36-39). hHEK293 cells were transiently transfected with the cDNAs (1 µg) codifying for
132 wild type (Wt) (hTRPA1-HEK293) or mutant human TRPA1 (C619S, C639S, C663S,
133 K708Q; 3C/K-Q hTRPA1-HEK293) (11) using the jetPRIME transfection reagent
134 (Poliplus-transfection® SA, Thermo Scientific, Monza, Milan), according to the
135 manufacturer's protocol.

136 Human embryonic lung fibroblasts (IMR90; ATCC® CCL-186™) were used as a
137 model of human cells constitutively expressing the TRPA1 channel and were cultured in
138 Dulbecco's Modified Eagle's Medium (DMEM) supplemented with 10% fetal bovine
139 serum (FBS), 2 mM glutamine, 100 U penicillin and 100 µg/ml streptomycin, according
140 to the manufacturer's instructions. Normal human bronchial epithelial cells (NHBE;
141 Lonza Group Ltd, Basel, Switzerland) were cultured in NHBE growth medium, according
142 to the manufacturer's instructions. All cells were cultured in an atmosphere of 95% air
143 and 5% CO₂ at 37 °C. For all cell lines, the cells were used when received without further
144 authentication.

145 Rodent primary sensory neurons were isolated from dorsal root ganglia (DRGs)
146 taken from Sprague-Dawley rats and cultured as previously described (35). Briefly,
147 ganglia were bilaterally excised under a dissection microscope and transferred in Hank's
148 balanced salt solution (HBSS) containing 2 mg/ml collagenase type 1A and 1 mg/ml
149 trypsin, for enzymatic digestion (30 min, 37 °C). Ganglia were then transferred to warmed
150 DMEM containing 10% FBS, 10% horse serum, 2 mM L-glutamine, 100 U/ml penicillin

151 and 100 mg/ml streptomycin and dissociated in single cells by several passages through
152 a series of syringe needles (23-25 G). Medium and ganglia cells were filtered to remove
153 debris and centrifuged. The pellet was resuspended in DMEM with added 100 ng/ml
154 mouse-nerve growth factor and 2.5 mM cytosine-b-D-arabino-furanoside free base.
155 Neurons were then plated on 25 mm-diameter glass coverslips coated with poly-L-lysine
156 (8.3 μ M) and laminin (5 μ M). DRG neurons were cultured for 3-4 days before being used
157 for calcium imaging experiments.

158

159 **2.3. Calcium Imaging Assay**

160 Single cell intracellular calcium was measured in untransfected and in hTRPA1-
161 HEK293, hTRPV1-HEK293, hTRPV4-HEK293, hTRPA1/V1-HEK293, 3C/K-Q
162 hTRPA1-HEK293 cells, IMR90 fibroblasts, NHBE cells, or in rat DRG neurons. Plated
163 cells were loaded with 5 μ M Fura-2AM-ester (Alexis Biochemicals; Lausen,
164 Switzerland) added to the buffer solution (37 °C) containing the following (in mM): 2
165 CaCl₂; 5.4 KCl; 0.4 MgSO₄; 135 NaCl; 10 D-glucose; 10 HEPES and 0.1% bovine serum
166 albumin at pH 7.4. After loading (40 min), cells were washed and transferred to a chamber
167 on the stage of an Olympus IX81 microscope for recording. Cells were excited
168 alternatively at 340 and 380 nm and recorded with a dynamic image analysis system
169 (XCellence Imaging software; Olympus srl, Milan, Italy). To evoke a TRPA1-dependent
170 calcium response, cells and neurons were challenged with AITC (1-1000 μ M), acrolein
171 (10 μ M), hydrogen peroxide (H₂O₂, 500 μ M), icilin (30 μ M), zinc chloride (ZnCl₂, 1 μ M)
172 or menthol (100 μ M). Buffer solution containing 1% dimethyl sulfoxide (DMSO) was
173 used as vehicle. The selective TRPV1 agonist, capsaicin (0.1 μ M), was used in hTRPV1-
174 HEK293, in hTRPA1/V1-HEK293 and, to identify TRPV1-expressing neurons and KCl

175 (50 mM), to identify the entire neuronal population (40). The selective TRPV4 agonist,
176 GSK1016790A (0.1 μ M), was used in hTRPV4-HEK293 cells. hTRPA1-HEK293,
177 hTRPV1-HEK293, hTRPV4-HEK293, hTRPA1/V1-HEK293, IMR90 fibroblasts and
178 NHBE cells were challenged with the activating peptide (AP) of the human proteinase
179 activated receptor 2 (hPAR2) (hPAR2-AP, SLIGKV-NH₂, 100 μ M).

180 Cells or neurons were pre-exposed (10 min) to ibuprofen-acyl glucuronide (1-300
181 μ M), ibuprofen (100 μ M), HC-030031 (0.1-30 μ M), capsazepine (10 μ M), HC-067047
182 (10 μ M) or vehicle (0.3% DMSO) before the addition of the TRPA1, TRPV1 or TRPV4
183 agonists. Results were expressed as the percentage of the increase in R_{340/380} over baseline,
184 normalized to the maximum effect induced by ionomycin (5 μ M) added at the end of each
185 experiment (% Change in R_{340/380}); or as the percentage of the inhibitory effect on the
186 calcium response evoked by AITC (% AITC response) for constructing the concentration-
187 response curves in the presence of ibuprofen-acyl glucuronide.

188

189 **2.4. Behavioral experiments**

190

191 **2.4.1. Treatment protocols**

192 C57BL/6J mice were injected in the plantar surface of the hind paw (intraplantar,
193 i.pl., 20 μ l/paw) with a mixture of AITC, acrolein or ZnCl₂ (all, 10 nmol) (40) and
194 ibuprofen-acyl glucuronide (0.3-300 nmol) or HC-030031 (0.3-300 nmol) or ibuprofen
195 (300 nmol), or capsaicin (1 nmol) and capsazepine (300 nmol), or hypotonic solution
196 (0.27% NaCl) and HC-067047 (300 nmol), or their vehicle (4% DMSO and 4% tween 80
197 in 0.9% NaCl), and acute nociceptive responses were recorded over the next 10 min (40,
198 41). Some C57BL/6J mice were treated intraperitoneally (i.p.) with ibuprofen-acyl

199 glucuronide (1, 10 and 100 mg/kg), HC-030031 (1, 10 and 100 mg/kg), ibuprofen (1, 10
200 and 100 mg/kg) or their vehicle (4% DMSO and 4% tween 80 in 0.9% NaCl) and 30 min
201 after treatment the acute nociceptive response to i.pl. injection of AITC (10 nmol) was
202 recorded over the next 10 min (40). Other C57BL/6J mice were treated intraperitoneally
203 (i.p.) with ibuprofen-acyl glucuronide (10 and 100 mg/kg), ibuprofen (10 and 100 mg/kg),
204 HC-030031 (100 mg/kg) (40), capsazepine (4 mg/kg) (40), HC-067047 (10 mg/kg) (42),
205 or their vehicle (4% DMSO and 4% tween 80 in 0.9% NaCl) and 30 min after treatment
206 the acute nociceptive responses to i.pl. injection of acrolein and ZnCl₂ (all, 10 nmol),
207 capsaicin (1 nmol) or hypotonic solution (0.27% NaCl) were recorded over the next 10
208 min (40).

209 For the carrageenan model, C57BL/6J mice were injected (i.pl., 20 µl/paw) with
210 carrageenan (300 µg), or its vehicle (0.9% NaCl), and mechanical allodynia was recorded
211 180 min after injection (17). Some C57BL/6J mice were treated (150 min after
212 carrageenan) by i.pl. (20 µl/paw) injection with ibuprofen-acyl glucuronide, ibuprofen
213 (all, 100 nmol), or a mixture of ibuprofen-acyl glucuronide or ibuprofen and HC-030031
214 (all, 100 nmol), or their vehicle (all 4% DMSO and 4% tween 80 in 0.9% NaCl).
215 Additional C57BL/6J mice were treated (150 min after carrageenan) with i.p. ibuprofen-
216 acyl glucuronide, ibuprofen (both 10 and 100 mg/kg), HC-030031 (100 mg/kg),
217 indomethacin (30 mg/kg) or their vehicles (4% DMSO and 4% tween 80 in 0.9% NaCl)
218 (40). Some *Trpa1*^{-/-} mice were treated (150 min after carrageenan) with i.p. ibuprofen-
219 acyl glucuronide (100 mg/kg).

220 For the formalin test, C57BL/6J mice were injected (i.pl., 20 µl/paw) with formalin
221 (0.5% in 0.9% NaCl) and the acute nociceptive response was monitored over the next 60
222 min and reported as phase I (0-10 min) and phase II (11-60 min) (16). Some animals were

223 pretreated by i.pl. (20 µl/paw) injection (10 min before) with ibuprofen-acyl glucuronide
224 and ibuprofen (both 100 nmol) or their vehicle (all 4% DMSO and 4% tween 80 in 0.9%
225 NaCl) or with i.p. ibuprofen-acyl glucuronide, ibuprofen (both 10 and 100 mg/kg, 30 min
226 before), HC-030031 (100 mg/kg, 60 min before) (16) and indomethacin (30 mg/kg, 30
227 min before) (40).

228

229 **2.4.2. Acute nociceptive test and Von Frey hair test**

230 Immediately after the i.pl. (20 µl/paw) injection with tested compounds, mice were
231 placed inside a plexiglass chamber and the total time spent in lifting/licking the injected
232 hind paw, as an indicative time of acute nociceptive response, was recorded for 10 min.
233 The i.pl. injection with vehicles of tested compounds produced nociceptive behavior for
234 a maximum of 2 s. Mechanical allodynia was measured in mice by the up-and-down
235 paradigm (43). Briefly, mice were placed individually in a plexiglass chamber designed
236 for the evaluation of mechanical thresholds (43) and were habituated to the room
237 temperature for at least 1 h before the test. Then, a series of 7 Von Frey hairs in logarithmic
238 increments of force (0.07, 0.16, 0.4, 0.6, 1, 1.4, 2 g) was used to stimulate the injected
239 hind paw. The response was considered positive when the mouse strongly withdrew the
240 paw. The stimulation started with the 0.6 g filament. The von Frey hairs were applied with
241 sufficient force to cause slight buckling and held for approximately 2-4 s. Absence of
242 response after 5 s led to the use of a filament with increased weight, whereas a positive
243 response led to the use of a weaker (*i.e.* lighter) filament. Six measurements were
244 collected for each mouse or until four consecutive positive or negative responses
245 occurred. The 50% mechanical withdrawal threshold (expressed in g) response was then
246 calculated from these scores, as previously described (43, 44). Mechanical nociceptive

247 threshold was determined before (basal level) and after different treatments.

248

249 **2.5. Prostaglandin E₂ assay**

250 C57BL/6J or *Trpa1*^{-/-} mice were injected (i.pl. 20 µl/paw) with carrageenan (300
251 µg) or its vehicle (0.9% NaCl) and 180 min after treatment the injected paws were
252 collected, weighed, frozen in liquid nitrogen and homogenized in sodium phosphate
253 buffer (PBS 0.1 M, pH 7.4) containing indomethacin (20 µM) to avoid further activation
254 of COX. Homogenates were centrifuged at 9000×g for 20 min at 4 °C (45). Supernatants
255 were collected and PGE₂ levels were measured by enzyme immunoassay (Abcam,
256 Cambridge, UK), according to the manufacturer's instructions. Some C57BL/6J were
257 treated (150 min after carrageenan) by i.pl. (20 µl/paw) injection with ibuprofen-acyl
258 glucuronide, ibuprofen (both, 100 nmol) or their vehicles (4% DMSO and 4% tween 80
259 in 0.9% NaCl). Other animals were treated (150 min after carrageenan) by i.p. injection
260 with ibuprofen-acyl glucuronide, ibuprofen (both, 100 mg/kg), HC-030031 (100 mg/kg,
261 i.p.), indomethacin (30 mg/kg, i.p.), or their vehicles (4% DMSO and 4% tween 80 in
262 0.9% NaCl).

263

264 **2.6. Molecular modeling**

265 *2.6.1. Protein structure refinement*

266 Molecular modeling studies were performed using the structure of the human
267 TRPA1 ion channel determined by electron cryo-microscopy (PDB code 3J9P) (46). The
268 missing side chains of partially resolved residues as well as the missing loop sequences
269 within the protein core structure were automatically reconstructed by using Modeller
270 software (47). The refined structure was then energy minimized in explicit water

271 environment, after being embedded in a lipid bilayer. The creation of the phospholipid
272 bilayer constituted by POPC (1-palmitoyl-2-oleoyl-sn-glycero-3-phosphocholine)
273 molecules and the insertion of the protein inside it were performed using Visual
274 Molecular Dynamics (VMD) software (48). The energy minimization was then carried
275 out with AMBER software, version 16. The system was solvated with a 15 Å water cap
276 on both the “intracellular” and the “extracellular” sides using the TIP3P solvent model,
277 while chloride ions were added as counterions to neutralize the system. The Lipid14
278 parameters (49) were assigned to POPC molecules. Three sequential minimization stages,
279 each consisting of 8000 steps of steepest descent followed by conjugate gradient, were
280 thus performed. In the first stage, a position restraint of 100 kcal/mol·Å² was applied on
281 the whole protein and phospholipid bilayer in order to uniquely minimize the positions of
282 the water molecules. In the second stage, the same position restraint was only applied on
283 the protein residues, thus leaving the phospholipid molecules free, while in the last stage
284 only the protein α carbons were restrained with a harmonic potential of 30 kcal/mol·Å².

285

286 2.6.2. *Ibuprofen-acyl glucuronide -TRPA1 covalent binding analysis*

287 Molecular docking studies were performed on the structurally refined and energy
288 minimized structure of hTRPA1 using the covalent docking protocol implemented in
289 Gold software (50). The calculations were performed selecting C621, C641 and C665 as
290 the covalently modified residues and the acyl portion of ibuprofen-acyl glucuronide
291 belonging to (*S*)-ibuprofen as the ligand moiety covalently bound to the residues. For each
292 of the three *S*-acyl-cysteine thioester adducts, 100 different ligand binding orientations
293 were evaluated, and the top-scored disposition was considered for further analyses. The
294 three ligand-protein complexes obtained were then subjected to molecular dynamic (MD)

295 simulations with AMBER 16. Each complex was initially subjected to three stages of
296 energy minimization as performed for protein refinement. Subsequently, the temperature
297 of the system was gradually raised from 0 to 300 K through a brief constant-volume MD
298 simulation where a position restraint of 30 kcal/mol·Å² was applied on the protein α
299 carbons. The system was then relaxed through a 500 ps constant-pressure MD simulation
300 in which the harmonic potential applied on the protein α carbons was gradually removed
301 and a Langevin thermostat was used to keep the temperature at 300 K. Finally, 20 ns of
302 constant-pressure MD simulation production were performed by leaving the whole
303 system free and using the Monte Carlo barostat with anisotropic pressure scaling for
304 pressure control. All simulations were performed using particle mesh Ewald electrostatics
305 with a cutoff of 10 Å for non-bonded interactions and periodic boundary conditions. A
306 simulation step of 2.0 fs was employed, as all bonds involving hydrogen atoms were kept
307 rigid using SHAKE algorithm. The Lipid14 parameters were assigned to POPC
308 molecules, while GAFF parameters were used for the ligand, whose partial charges were
309 calculated with the AM1-BCC method as implemented in the Antechamber suite of
310 AMBER 16. Linear interaction energy (LIE) evaluations were performed between the
311 ligand (*i.e.* the atoms constituting the S-acyl moiety belonging to ibuprofen of the
312 covalent adduct) and the protein residues located within a 12 Å radius from it. The *ccptraj*
313 analysis program module of AMBER 16, was employed for the calculations, using the
314 trajectories extracted from the last 10 ns of MD simulation, for a total of 100 snapshots
315 (with a time interval of 100 ps).

316

317 **2.7. IL-8 release assay**

318 For IL-8 ELISA assay, NHBE cells were seeded in complete culture medium in 48-

319 well plates, grown to ~80-90% confluence, and incubated overnight in serum-free
320 medium before treatments. All the treatments were then performed in serum free medium.
321 Cells were pretreated (30 min) with HC-030031 (50 μ M), ibuprofen-acyl glucuronide and
322 ibuprofen (both, 100 μ M) or vehicle (1% DMSO) before incubation (18 h at 37 °C in 5%
323 CO₂) with freshly prepared AITC (10-30 μ M) and TNF- α (0.2 nM). Supernatants were
324 then collected, and the human IL-8 content was assayed using a paired antibody
325 quantitative ELISA kit (Invitrogen, Milan, Italy) (detection limit: 5 pg/ml). The assay was
326 performed according to the manufacturer's instructions.

327

328 **2.8. Data and statistical analysis**

329 All data were expressed as mean \pm s.e.m or confidence interval (CI). Statistical
330 analysis was performed by the one-way analysis of variance (ANOVA) followed by the
331 post-hoc Bonferroni's test for comparisons of multiple groups. For behavioural
332 experiments with repeated measures, the two-way ANOVA followed by the post-hoc
333 Bonferroni's test was used. Statistical analysis was performed on raw data using
334 GraphPad software (GraphPad Prism version 6.00, San Diego, CA, USA). P<0.05 was
335 considered statistically significant.

336

337 **3. Results**

338 **3.1. Ibuprofen-acyl glucuronide antagonizes human and rodent TRPA1**

339 The ability of ibuprofen-acyl glucuronide to affect TRPA1-mediated calcium
340 responses was studied by using a single cell assay in human and rodent cells expressing
341 TRPA1. Ibuprofen-acyl glucuronide did not evoke *per se* any calcium response in
342 hTRPA1-HEK293 cells (Fig. 1B,I). However, ibuprofen-acyl glucuronide, like the
343 selective TRPA1 antagonist, HC-030031, inhibited in a concentration-dependent manner
344 calcium response evoked by AITC [IC₅₀, 30 (CI, 22-40) μM and 3 (CI, 1.4-6) μM,
345 respectively] (Fig. 1C). Ibuprofen-acyl glucuronide reduced calcium responses evoked
346 by additional reactive TRPA1 agonists, such as acrolein or hydrogen peroxide (H₂O₂)
347 (Fig. 1D), but did not affect the responses by non-reactive agonists, icilin and zinc
348 chloride (ZnCl₂) (Fig. 1D), which do not act by binding key cysteine residues of TRPA1
349 (51, 52). HC-030031 abolished the calcium responses evoked by both reactive and non-
350 reactive agonists (Fig 1D). Ibuprofen-acyl glucuronide did not attenuate the rapid calcium
351 responses evoked by acute exposure to the activating peptide (AP) of the human protease-
352 activated receptor 2 (hPAR2) (hPAR2-AP) (Fig. 1D). This finding supports the selectivity
353 of ibuprofen-acyl glucuronide. The ability of ibuprofen-acyl glucuronide to inhibit
354 TRPA1 by binding key cysteine and lysine residues was further proved by the study of
355 the mutated human TRPA1 (3C/K-Q hTRPA1), which lacks the cysteine and lysine
356 residues, required for channel activation by reactive agonists, and which responds to
357 menthol (9, 11, 12). Calcium responses to menthol (100 μM) were unaffected by
358 ibuprofen-acyl glucuronide in 3C/K-Q hTRPA1-HEK293 cells (Fig 1E).

359 Selectivity of ibuprofen-acyl glucuronide for TRPA1 was robustly confirmed by a
360 series of observations. In hTRPV1-HEK293, calcium responses to the TRPV1 agonist,

361 capsaicin, were ablated by the TRPV1 selective antagonist, capsazepine, but were
362 unaffected by ibuprofen-acyl glucuronide (Fig. 1F). In hTRPA1/TRPV1-HEK293 co-
363 expressing cells, responses to capsaicin were attenuated by capsazepine, but not by
364 ibuprofen-acyl glucuronide, whereas responses to AITC were ablated by ibuprofen-acyl
365 glucuronide and HC-03003, but not by capsazepine (Fig. 1G). Moreover, in hTRPV4-
366 HEK293 cells, calcium responses to the selective TRPV4 agonist, GSK1016790A, were
367 ablated by a TRPV4 antagonist, HC-067047, but were unaffected by ibuprofen-acyl
368 glucuronide (Fig. 1H). Ibuprofen did not evoke *per se* any calcium responses and did not
369 affect the calcium responses evoked by AITC, acrolein or H₂O₂ in hTRPA1-HEK293 cells
370 (Fig. 1D,I). The glucuronidated metabolite of indomethacin, acyl-β-D-glucuronide,
371 neither evoked calcium response nor reduced the calcium response evoked by AITC in
372 hTRPA1-HEK293 cells (Fig. 1I).

373 Ibuprofen-acyl glucuronide also inhibited the AITC-evoked calcium response in
374 IMR90 cells, a cell line where TRPA1 was originally cloned, (53) (Fig. 2A), and which
375 constitutively expresses the channel. Ibuprofen-acyl glucuronide [IC_{50s}, 60 (CI, 45-88)
376 μM] and HC-030031 [IC_{50s}, 3 (CI, 2-6) μM] reduced AITC-evoked calcium responses
377 (Fig. 2B,C). Ibuprofen-acyl glucuronide failed to attenuate rapid calcium responses
378 evoked by acute exposure to hPAR2-AP (Fig. 2C). Ibuprofen-acyl glucuronide [IC₅₀, 50
379 (CI, 40-70) μM] and HC-030031 [IC₅₀, 1 (CI, 0.3-1.8) μM] reduced AITC-evoked
380 calcium responses in cultured rat dorsal root ganglion (rDRG) neurons, which express the
381 native TRPA1 (Fig. 2D-F). Ibuprofen-acyl glucuronide did not affect calcium responses
382 to other excitatory stimuli, such as capsaicin and high potassium chloride (KCl) (Fig 2G).
383 Thus, ibuprofen-acyl glucuronide was able to selectively block the human and rodent
384 TRPA1 channel.

385

386 **3.2. Mode of TRPA1 targeting by ibuprofen-acyl glucuronide**

387 A covalent docking approach was applied to evaluate the binding mode of the
388 possible covalent adducts formed by transacylation of ibuprofen-acyl glucuronide with
389 residues C621, C641 and C665, since the mutation of these residues abolished the
390 inhibitory activity of the ligand on TRPA1. Moreover, these solvent accessible residues
391 are located in an allosteric nexus of the TRPA1 channel, suitable for the detection of
392 electrophile agonists (46), and have been demonstrated to exert a fundamental role in
393 TRPA1 activation by reactive agonists like AITC (11). The structure of the human
394 TRPA1 ion channel recently determined by electron cryo-microscopy (PDB code 3J9P)
395 was employed for this analysis (46). After refining the protein structure (see Materials
396 and Methods for details), the covalent docking protocol implemented in Gold software
397 was applied to evaluate the binding orientations of the thioester adducts formed by
398 reaction of ibuprofen-acyl glucuronide with C621, C641 and C665, corresponding to the
399 acylation of cysteine thiol groups with the ligand acyl moiety belonging to ibuprofen. For
400 each S-acyl-cysteine adduct, the top-scored binding disposition of the ligand was taken
401 into account and further analyzed through MD simulation studies. After embedding the
402 covalently modified protein in a lipid bilayer and solvating the system with explicit water
403 molecules, 20 ns of MD simulation were performed (see Materials and Methods for
404 details). The results were then analyzed in terms of ligand-protein interaction energy, in
405 order to evaluate the reliability of the predicted covalent adducts from an energetic point
406 of view. For this purpose, the linear interaction energy (LIE) approach was employed.

407 LIE evaluations allow the calculation of the non-bonded interactions between the
408 ligand and the surrounding protein residues from the trajectories generated through MD

409 simulations. Electrostatic and van der Waals energetic contributions are calculated for
410 each MD snapshot and the obtained values are then used to derive the average total ligand-
411 protein interaction energy. In this case, LIE evaluations were performed between the
412 atoms constituting the acyl moiety belonging to ibuprofen of the three predicted S-acyl-
413 cysteine covalent adducts and the protein residues located within a radius of 12 Å. The
414 MD trajectories extracted from the last 10 ns of MD simulation were used for the
415 calculations, for a total of 100 snapshots (with a time interval of 100 ps). The average LIE
416 values (aLIE) were obtained for the three different covalent complexes as the sum of the
417 average electrostatic (EELE) and van der Waals (EVDW) energy contributions expressed
418 as kcal/mol (Fig. 3A).

419 The linear interaction energy evaluations highlighted the S-acyl-C621 thioester as
420 the most energetically favored covalent adduct, presenting a linear interaction energy
421 value (-31.9 kcal/mol) exceeding those estimated for the S-acyl-C641 and S-acyl-C665
422 covalent complexes by about 12 and 18 kcal/mol, respectively. Interestingly, the homolog
423 of C621 in mouse TRPA1 (C622) was found to be the cysteine residue that most affected
424 TRPA1 activation by reactive agonists, since its mutation completely abolished the
425 responsiveness of TRPA1 to AITC (12). The average binding disposition of ibuprofen
426 within the S-acyl-C621 thioester adduct obtained from the last 10 ns of molecular
427 dynamics simulation was obtained (Fig. 3B). The acyl chain belonging to ibuprofen
428 perfectly fits a small hydrophobic pocket constituted by I611, F612, P617, V678, I679
429 and Y680, delimited by K610 and D677 from one side and T684 from the other. In
430 particular, the aromatic moiety of the ligand lies on the P617 side chain, forming
431 lipophilic interactions with this residue, as well as with I622 and I679, while the *p*-
432 isobutyl group is sandwiched between F612 and V678, showing strong hydrophobic

433 contacts with this latter residue. Moreover, the ligand carbonyl oxygen forms a hydrogen
434 bond with the backbone nitrogen of Y680 that is maintained for about 80% of the entire
435 molecular dynamics simulation, thus contributing to the anchoring of the ligand to the
436 hydrophobic pocket. Interestingly, the S-acyl-C621 thioester was the only covalent
437 complex in which a stable hydrogen bond between the ligand portion and the surrounding
438 protein residues was observed (Fig. 3B).

439

440 **3.3. Ibuprofen-acyl glucuronide selectively inhibits TRPA1-mediated** 441 **nocifensor responses.**

442 Next, we speculated that ibuprofen-acyl glucuronide produces *in vivo*
443 antinociceptive effects *via* TRPA1 antagonism. The intraplantar (20 μ l/paw)
444 administration of ibuprofen-acyl glucuronide or HC-030031 dose-dependently reduced
445 [ID₅₀ of 4 (CI, 2-9) nmol, and ID₅₀, 8 (CI, 3-23) nmol, respectively] the acute nociceptive
446 response evoked by the injection of AITC (intraplantar). Maximum inhibition on the
447 nociceptive responses evoked by AITC (intraplantar) was 72% \pm 2% for ibuprofen-acyl
448 glucuronide and, 89% \pm 1.7% for HC-030031 (n = 6, p < 0.05) (Fig. 4A). Acute
449 nociceptive responses induced by intraplantar capsaicin and hypotonic solution (TRPV1
450 and TRPV4 -mediated responses, respectively) were attenuated by injection of the
451 respective channel antagonists, capsazepine and HC-067047, but were unaffected by
452 ibuprofen-acyl glucuronide (all intraplantar) (Fig. 4B). The nociceptive response evoked
453 by acrolein (intraplantar) was inhibited by ibuprofen-acyl glucuronide and HC-030031
454 (both intraplantar) (Fig. 4C). In contrast, ibuprofen-acyl glucuronide (intraplantar) failed
455 to affect nociceptive response evoked by the non-covalent agonist, ZnCl₂ (intraplantar),
456 which, however, was attenuated by HC-030031 (intraplantar) (Fig. 4C). Ibuprofen

457 intraplantar administration failed to affect the acute nociceptive response evoked by either
458 AITC, acrolein or ZnCl₂ (all intraplantar) (Fig. 4C,D).

459 The systemic (intraperitoneal) administration of HC-030031, ibuprofen-acyl
460 glucuronide and ibuprofen dose-dependently [ID_{50s} 7 (CI, 4-14) mg/kg, 10 (CI, 4-20)
461 mg/kg and ID_{50s} 27 (CI, 8-90) mg/kg, respectively] reduced the nociceptive responses to
462 AITC (intraplantar) (Fig. 4E). Maximum inhibition by ibuprofen (42% ± 3%) was lower
463 than those produced by ibuprofen-acyl glucuronide (76% ± 4%) and HC-030031 (83 ±
464 4%) (all 100 mg/kg, n = 6 each, *P* < 0.05 ibuprofen vs. both ibuprofen-acyl glucuronide
465 and HC-030031) (Fig. 4E). Systemic (intraperitoneal) ibuprofen-acyl glucuronide did not
466 affect the nociceptive responses evoked by either capsaicin or a hypotonic solution,
467 which, however, were attenuated by the TRPV1 and TRPV4 antagonists, capsazepine and
468 HC067047, respectively (Fig 4F). Systemic (intraperitoneal) ibuprofen-acyl glucuronide
469 (both, 10 and 100 mg/kg) reduced the nociception evoked by acrolein but not that evoked
470 by ZnCl₂ (Fig. 4G,H), whereas only 100 mg/kg, but not 10 mg/kg (both intraperitoneal)
471 ibuprofen reduced the nociceptive responses evoked by acrolein (Fig. 4G). Ibuprofen-
472 acyl glucuronide at both 10 and 100 mg/kg was more effective than the respective doses
473 of ibuprofen (Fig. 4E,G). Finally, systemic (intraperitoneal) HC-030031 inhibited the
474 nociceptive responses evoked by both acrolein and ZnCl₂ (Fig. 3G,H).

475

476

477

478 **3.4. Ibuprofen-acyl glucuronide reduces TRPA1-dependent hyperalgesia and** 479 **nociception in models of inflammatory pain.**

480 We tested the ability of ibuprofen-acyl glucuronide to reduce mechanical allodynia

481 evoked by intraplantar carrageenan injection in the mouse hind paw. Carrageenan induces
482 a prolonged mechanical allodynia that is in part mediated by TRPA1 (17, 18). Ibuprofen-
483 acyl glucuronide (intraplantar, 2.5 hours after carrageenan) almost completely attenuated
484 mechanical allodynia (Fig. 5A), whereas an identical dose of ibuprofen produced a partial
485 inhibition (Fig. 5B). A combination of HC-030031 and ibuprofen (both intraplantar)
486 increased the effect of ibuprofen alone, but did not further affect the inhibitory response
487 to ibuprofen-acyl glucuronide alone (Fig. 5A,B).

488 A low systemic (intraperitoneal) dose (10 mg/kg) of ibuprofen-acyl glucuronide,
489 but not ibuprofen, significantly reduced carrageenan-evoked mechanical allodynia (Fig
490 5C). A systemic (intraperitoneal) high dose (100 mg/kg) of ibuprofen-acyl glucuronide or
491 ibuprofen attenuated the mechanical allodynia induced by carrageenan, but the effect of
492 ibuprofen-acyl glucuronide resulted higher than that of ibuprofen (Fig. 5D,E). The
493 combination of systemic (both intraperitoneal) HC-030031 and ibuprofen increased the
494 inhibitory action of ibuprofen alone, but did not affect the inhibitory response to
495 ibuprofen-acyl glucuronide alone (Fig. 5D,E). Systemic (intraperitoneal) indomethacin
496 partially inhibited carrageenan-induced mechanical allodynia, and its combination with
497 HC-030031 completely reversed mechanical allodynia (Fig. 5F). Prostaglandin E₂ (PGE₂)
498 assay from paw homogenates of mice receiving carrageenan and treated by local
499 (intraplantar, both 100 nmol) or systemic (intraperitoneal, both 100 mg/kg) ibuprofen-
500 acyl glucuronide or ibuprofen revealed that both drugs produced a similar and complete
501 reduction in the tissue content of PGE₂ (Fig 5G,H). Systemic (intraperitoneal)
502 indomethacin, but not HC-030031, reduced PGE₂ content in paw homogenates (Fig 5H).
503 Finally, ibuprofen-acyl glucuronide attenuated carrageenan-evoked PGE₂ release in
504 TRPA1 deleted (*Trpa1*^{-/-}) mice (Fig 5I). Thus, ibuprofen-acyl glucuronide maintains the

505 ability of the parent compound to inhibit COXs.

506 Formalin injection (intraplantar) into the hind paw of the mouse classically induces
507 a biphasic nociceptive response, with phase I being entirely dependent on TRPA1 (16),
508 whereas phase II involves different mechanisms, including the release of prostanoids.
509 However, during phase II, ongoing diffusion and spread of formalin along TRPA1-
510 expressing nerves may elicit release of a large variety of different mediators, among
511 which prostanoids (54), which may sensitize TRPA1 (55). Ibuprofen-acyl glucuronide
512 injection (intraplantar) attenuated both phase I and phase II of the response (Fig. 6A). In
513 contrast, ibuprofen failed to affect phase I, but reduced phase II of the formalin test (Fig.
514 6A). Systemic (intraperitoneal) administration of ibuprofen-acyl glucuronide (10 and 100
515 mg/kg) reduced phase I of the formalin test (Fig. 6B). However, only 100 mg/kg, but not
516 10 mg/kg (i.p.), of ibuprofen inhibited phase I of the formalin test (Fig. 6B). HC-030031
517 (16), but not indomethacin (56), inhibited phase I of the formalin test (Fig. 6B), whereas
518 phase II was attenuated by both drugs (Fig. 6B).

519

520 **3.4. Ibuprofen-acyl glucuronide reduces interleukin-8 release evoked by TRPA1** 521 **stimulation from bronchial epithelial cells.**

522 TRPA1 expressed by various non-neuronal cells of the airways elicits calcium
523 responses and the release of proinflammatory cytokines, including interleukin-8 (IL-8)
524 (25-27). The calcium responses evoked by AITC in NHBE cells, which constitutively
525 express TRPA1 (27), were attenuated in a concentration-dependent manner by ibuprofen-
526 acyl glucuronide [IC₅₀, 20 (CI, 13-40) μM] and HC-030031 [IC₅₀, 10 (CI, 8-12) μM] (Fig.
527 7A-C). Ibuprofen-acyl glucuronide failed to attenuate the rapid calcium responses evoked
528 by acute exposure to hPAR2-AP (Fig. 7C). Exposure to AITC induced a concentration-

529 related release of IL-8 from cultured NHBE cells. This effect was attenuated in the
530 presence of both ibuprofen-acyl glucuronide and HC-030031, but not in the presence of
531 ibuprofen (Fig. 7D). The observation that HC-030031, ibuprofen-acyl glucuronide or
532 ibuprofen did not affect IL-8 release evoked by TNF- α indicated selectivity of ibuprofen-
533 acyl glucuronide and HC-030031 for the AITC-evoked effects (Fig. 7D).
534

4. Discussion

535

536

537 The COX inhibitor ibuprofen is widely used as a first line treatment for the relief
538 of pain and inflammation (2). Glucuronide metabolites, including those generated from
539 ibuprofen, are generally considered inactive and rapidly excreted compounds (57).
540 However, acyl glucuronides, undergoing hydrolysis, acyl migration and molecular
541 rearrangement, exhibit chemical reactivity that allow them to covalently bind various
542 macromolecules (57-59). TRPA1 belongs to such macromolecules that, through Michael
543 addition, undergo nucleophilic attack *via* specific cysteine/lysine residues (11, 12).
544 Therefore, we hypothesized that, as with various reactive compounds, ibuprofen-acyl
545 glucuronide may react with TRPA1 (11, 12). Our major finding is that ibuprofen-acyl
546 glucuronide, but not its parent compound, ibuprofen, antagonizes the proalgesic TRPA1
547 channel. This conclusion derives, primarily, from the *in vitro* pharmacological profile of
548 ibuprofen-acyl glucuronide, which, unlike ibuprofen, selectively inhibits the recombinant
549 and native human TRPA1 and the native rodent channel in nociceptors. Failure of the acyl
550 derivative of indomethacin to affect channel activity underlines the unique ability of
551 ibuprofen-acyl glucuronide to target TRPA1.

552 Indication that the reactive property of ibuprofen-acyl glucuronide is needed for
553 efficient TRPA1 targeting is based on functional experiments with the mutated form of
554 the human TRPA1 channel, and on docking and molecular dynamic simulations. The
555 mutant hTRPA1-3C/K-Q has the unique property of responding to non-reactive agonists,
556 such as menthol and icilin (9, 11, 12), but not to reactive agonists, including AITC. In
557 hTRPA1-3C/K-Q expressing cells, ibuprofen-acyl glucuronide did not affect the calcium
558 response evoked by menthol. Thus, the ability of ibuprofen-acyl glucuronide to inhibit

559 TRPA1 depends on the cysteine/lysine residues required for channel activation by
560 electrophilic/reactive agonists. Acyl-glucuronides are known to react by transacylation
561 with nucleophilic residues, leading to the formation of a covalent adduct in which the acyl
562 group, linked to the glucuronide, is transferred to the nucleophilic atom of the residue
563 (57-59). To explore the interaction between ibuprofen-acyl glucuronide G and the human
564 TRPA1 channel we performed computational studies, including molecular docking and
565 dynamic simulations, which predicted the formation of covalent adducts between
566 ibuprofen-acyl glucuronide and TRPA1. Computational results with the mutated channel
567 confirm that the inhibitory activity of ibuprofen-acyl glucuronide should be ascribed to
568 its interaction with one of the mutated residues. *In vivo* results that ibuprofen-acyl
569 glucuronide attenuated nociception evoked by reactive TRPA1 agonists, but not those
570 produced by non-reactive agonists, such as icilin and zinc chloride, further supported the
571 *in vitro* data and simulation experiments, underlining that chemical reactivity is required
572 for TRPA1 targeting by ibuprofen-acyl glucuronide.

573 Additional *in vivo* data strengthen the conclusion obtained from *in vitro* findings.
574 Local injection of ibuprofen-acyl glucuronide in the mouse hind paw prevented acute
575 nociception elicited by local administration of the reactive TRPA1 agonists, AITC and
576 acrolein, but was ineffective against TRPV1 or TRPV4 agonists, indicating selectivity.
577 Notably, local injection of ibuprofen in the mouse hind paw did not affect AITC or
578 acrolein-evoked nociception. It is possible that following i.pl. ibuprofen no ibuprofen-
579 acyl glucuronide is generated locally, and the action of TRPA1 agonists remains
580 unopposed. However, about 10-15% of systemic ibuprofen is converted into ibuprofen-
581 acyl glucuronide (28). Thus, liver metabolism of a high dose of ibuprofen may produce
582 ibuprofen-acyl glucuronide levels such as to guarantee a local concentration sufficient for

583 inhibiting TRPA1. This hypothesis is supported by the observation that a high dose of
584 systemic ibuprofen produced a partial attenuation of the nociception evoked by AITC.

585 Other NSAIDs, which derive from propionic acid, are known to generate acyl
586 glucuronides through hepatic metabolism. These acyl derivatives could potentially
587 possess anti-TRPA1 properties similar to those of ibuprofen-acyl glucuronide. However,
588 acyl glucuronidation does not warrant *per se* that the metabolites possess the chemical
589 requirements for effective TRPA1 antagonism. For example, we failed to detect any effect
590 of the acyl derivative of indomethacin, acyl- β -D-glucuronide, in antagonizing AITC
591 evoked calcium response *in vitro*, and systemic indomethacin pretreatment did not affect
592 the acute nociception of phase I of the formalin test.

593 The analgesic action of ibuprofen derives from its ability to inhibit COXs, and the
594 ensuing blockade of prostaglandin generation (3, 4). This feature also justifies the anti-
595 inflammatory activity of ibuprofen. While we provided evidence that ibuprofen-acyl
596 glucuronide targets TRPA1, we wondered whether it maintains the ability of the parent
597 drug to inhibit COXs. We also wondered whether ibuprofen-acyl glucuronide ability to
598 inhibit TRPA1 may exert anti-inflammatory activity in an ibuprofen-independent manner.
599 Carrageenan injection in rodent paw evokes inflammation and prolonged allodynia that
600 are in part mediated by prostaglandins and in part by TRPA1 (17, 18, 40, 60). When
601 allodynia was analyzed, local (intraplantar) ibuprofen-acyl glucuronide elicited a more
602 robust inhibitory effect than that of an identical dose of ibuprofen, and the combination
603 with HC-030031 potentiated inhibition by ibuprofen, but not that by ibuprofen-acyl
604 glucuronide. Because both ibuprofen-acyl glucuronide and ibuprofen ablated PGE₂ levels
605 it is possible that the effect of locally administered ibuprofen-acyl glucuronide is due to

606 both COX inhibition and TRPA1 antagonism, whereas locally administered ibuprofen
607 solely inhibits COXs.

608 The study of systemic administered drugs strengthens this hypothesis. A low dose
609 of ibuprofen-acyl glucuronide, but not ibuprofen, attenuated carrageenan-evoked
610 allodynia. A high dose of ibuprofen-acyl glucuronide or ibuprofen completely reversed
611 or partially inhibited allodynia, respectively. Furthermore, the combination of the high
612 dose of ibuprofen and HC-030031 potentiated the effect of ibuprofen alone. Similar
613 results were obtained with indomethacin (its metabolite, acyl- β -D-glucuronide-
614 indomethacin, does not target TRPA1) alone or in combination with HC-030031. Thus,
615 TRPA1 stimulation by endogenous agonists generated by carrageenan-evoked
616 inflammation cannot be completely surmounted by the amount of ibuprofen-acyl
617 glucuronide generated by systemic metabolism of 100 mg/kg ibuprofen. The observation
618 that both systemic ibuprofen and ibuprofen-acyl glucuronide completely inhibited PGE₂
619 generation evoked by carrageen, indicates that the metabolite maintains the COX
620 inhibitory activity of the parent drug, and justify the complete attenuation of carrageenan-
621 evoked allodynia by ibuprofen-acyl glucuronide which may simultaneously inhibit COXs
622 and TRPA1. TRPA1 has been reported to contribute to inflammation by different
623 pathways, including the release of pro-inflammatory cytokines, such as IL-8 (25, 26). The
624 present *in vitro* observation that ibuprofen-acyl glucuronide, but not ibuprofen, attenuates
625 the TRPA1-dependent ability of NHBE cells to release IL-8 underlines the contribution
626 of the COX-independent anti-inflammatory activity of the metabolite.

627 Our findings add new insights into the antinociceptive/anti-hyperalgesic and anti-
628 inflammatory activity of ibuprofen which, in addition to COX inhibition, attenuates
629 TRPA1 activity *via* ibuprofen-acyl glucuronide generation. This novel mechanism of

630 ibuprofen/ibuprofen-acyl glucuronide indirectly underlines the TRPA1 contribution to
631 acute nociception and delayed allodynia in various models of inflammatory pain. Further
632 studies are needed to establish whether TRPA1 antagonism by ibuprofen-acyl
633 glucuronide contributes to the therapeutic effect of ibuprofen in pain and inflammation in
634 humans, and whether ibuprofen-acyl glucuronide may have an efficacy and safety profile
635 different from its parent drug.

893 *reactive TRPA1 agonists in mice.* (A) Dose-dependent inhibitory effect of intraplantar
894 (i.pl., 20 μ l/paw) administration of IAG (0.3-300 nmol) and HC-030031 (HC-03, 0.3-300
895 nmol) on the acute nociceptive response evoked by i.pl. allyl isothiocyanate (AITC, 20
896 nmol) in C57BL/6J mice. (B) Effect of IAG (300 nmol), capsazepine (CPZ, 300 nmol)
897 and HC-067047 (HC-06, 300 nmol) on the acute nociceptive response evoked by i.pl.
898 CPS (1 nmol) and NaCl 0.27% in C57BL/6J mice. (C) Effect of i.pl. IAG (300 nmol),
899 HC-03 (300 nmol) and ibuprofen (Ibu, 300 nmol) on the nociceptive response evoked by
900 i.pl. acrolein (ACR, 10 nmol) and zinc chloride ($ZnCl_2$, 10 nmol) in C57BL/6J mice. (D)
901 Effect of Ibu (300 nmol) on the nociceptive response evoked by i.pl. AITC (20 nmol) in
902 C57BL/6J mice. (E) Dose-response inhibitory effect of intraperitoneal (i.p.)
903 administration of IAG, Ibu and HC-03 (all, 1-100 mg/kg) on the acute nociceptive
904 response evoked by i.pl. AITC (20 nmol) in C57BL/6J mice. (F) Effect of i.p. IAG (100
905 mg/kg) CPZ (4 mg/kg) and HC-06 (10 mg/kg) on the acute nociceptive response evoked
906 by i.pl. CPS (1 nmol) and NaCl 0.27% in C57BL/6J mice. (G) Effect of i.p. IAG, Ibu
907 (both, 10 and 100 mg/kg) and HC-03 (100 mg/kg) on the acute nociceptive response
908 evoked by i.pl. ACR (10 nmol). (H) Effect of IAG (100 mg/kg) and HC-03 (100 mg/kg)
909 on the acute nociceptive response evoked by i.pl. $ZnCl_2$ (10 nmol). Values are mean \pm
910 s.e.m of n=6 mice for each experimental condition. Veh indicates vehicle of CPS, NaCl
911 0.27%, ACR, $ZnCl_2$ and AITC, dash (-) indicates vehicles of IAG, HC-03, ibu, CPZ and
912 HC-06. * P <0.05 vs. Veh; § P <0.05 vs. CPS or NaCl 0.27%, ACR and $ZnCl_2$, $^{\#}$ P <0.05 vs.
913 HC-03 and IAG. One-way ANOVA and post-hoc Bonferroni's test.

914

915 **Figure 5.** *Ibuprofen-acyl glucuronide produces anti-hyperalgesic effect in the*
916 *carrageenan model of inflammatory pain.* (A,B) Time course of the inhibitory effect of
917 intraplantar (i.pl., 20 μ l/paw) administration of IAG, Ibuprofen (Ibu) (both, 100 nmol) or
918 of a mixture of IAG and HC-030031 (HC-03) or Ibu and HC-03 (all, 100 nmol) on the
919 mechanical allodynia evoked by i.pl. carrageenan (Cg, 300 μ g) in C57BL/6J mice. (C-E)
920 Time course of the inhibitory effect of intraperitoneal (i.p.) administration of IAG, Ibu
921 (both, 10 and 100 mg/kg) or a combination of IAG (100 mg/kg) or ibu (100 mg/kg) and
922 HC-03 (100 mg/kg) on the mechanical allodynia evoked by i.pl. injection of Cg (300 μ g)
923 in C57BL/6J mice. (F) Time course of the inhibitory effect of i.p. HC-03 (100 mg/kg) and
924 indomethacin (indo, 30 mg/kg) or a combination of both HC-03 (100 mg/kg) and indo
925 (30 mg/kg) on the mechanical allodynia evoked by i.pl. injection of Cg (300 μ g) in
926 C57BL/6J mice. (G) PGE₂ levels in paw homogenates measured 180 min after i.pl. Cg
927 (300 μ g) in C57BL/6J mice treated with IAG or Ibu (both, 100 nmol, i.pl.). (H) PGE₂
928 levels in paw homogenates measured 180 min after i.pl. Cg (300 μ g) in C57BL/6J mice
929 treated with IAG, Ibu, HC-03 (all, 100 mg/kg, i.p.) or indo (30 mg/kg, i.p.). (I) PGE₂
930 levels in paw homogenates measured 180 min after i.pl. Cg (300 μ g) in *Trpa1*^{-/-} mice after
931 IAG (100 mg/kg, i.p.). Values are mean \pm s.e.m of n=6 mice for each experimental
932 condition. Veh indicates vehicle of Cg, dash (-) indicates vehicles of IAG, Ibu, HC-03
933 and indo. **P*<0.05 vs. Veh; §*P*<0.05 vs. Cg. #*P*<0.05 vs. Cg/Ibu or Cg/HC-03 or Cg/indo.
934 One- and two-way ANOVA and post-hoc Bonferroni's test.

935

936 **Figure 6.** *Ibuprofen-acyl glucuronide produces antinociception effect in the*
937 *formalin model of inflammatory pain.* (A) Effect of intraplantar (i.pl., 20 μ l/paw)

938 administration of IAG and ibuprofen (Ibu) (both, 100 nmol) on phase I and phase II of
939 the formalin test. (B) Effect of intraperitoneal (i.p.) administration of IAG, Ibu (both, 10
940 and 100 mg/kg), HC-030031 (HC-03, 100 mg/kg) and indomethacin (Indo, 30 mg/kg) on
941 phase I and phase II of the formalin test. Values are mean \pm s.e.m of n=6 mice for each
942 experimental condition. Veh indicates vehicle of formalin, dash (-) indicates vehicles of
943 IAG, Ibu, HC-03 and Indo. * P <0.05 vs. Veh; § P <0.05 vs. formalin. One-way ANOVA
944 and post-hoc Bonferroni's test.

945

946 **Figure 7.** *Ibuprofen-acyl glucuronide antagonizes human native TRPA1 in NHBE*
947 *cells reducing the IL-8 release.* (A) Typical traces of the effect of pre-exposure (10 min)
948 to Veh (vehicle) IAG/IAG (100 μ M) on the calcium response evoked by AITC (1 mM)
949 and the hPAR2-AP (100 μ M) in NHBE cells. (B,C) Concentration-response curves and
950 pooled data of the inhibitory effect of IAG (0.1-1000 μ M) and HC-030031 (HC-03, 0.1-
951 1000 μ M) on the calcium response evoked by AITC (1 mM) in NHBE cells. (D) IL-8
952 release from NHBE cells exposed to AITC (10 and 30 μ M) or TNF- α (0.2 nM) and
953 pretreated with IAG and ibuprofen (Ibu) (both, 100 μ M) and HC-03 (30 μ M). Values are
954 mean \pm s.e.m. of n>25 cells from at least 3 different experiments for each condition or at
955 least 3 independent experiments. Veh indicates vehicle of AITC and TNF- α , dash (-)
956 indicates vehicles of IAG, Ibu and HC-03. * P <0.05 vs. Veh; § P <0.05 vs. AITC. One-way
957 ANOVA and post-hoc Bonferroni's test.
