# Organic \& Biomolecular Chemistry (OBC) 

Impact factor 3.562*

$O B C$ aims to provide authors with a quick decision on their manuscript. We would appreciate you assisting us in providing this service by submitting your review by the deadline in the invitation message.

## When assessing this manuscript please take the following into account:

- $O B C$ articles should report new work which makes a highly-significant impact in the field. Specific guidance on this is on the next page.
- Articles should be scientifically sound with the conclusions supported by the experimental data.
- Please comment on the novelty and likely impact of the work. Routine and incremental work should generally not be recommended for publication in $O B C$; even if competently researched and reported. If you rate the article as 'routine' yet recommend acceptance, please give specific reasons for this in your report.
- $O B C$ has recently updated its characterisation guidelines.

Best wishes,

Richard Kelly
Editor, Organic \& Biomolecular Chemistry

[^0]
## *New* Scope and Standards

OBC's scope includes total synthesis, synthetic methodology and bioorganic chemistry as well as organic and bioorganic aspects supramolecular and macromolecular chemistry, theoretical and computational chemistry, catalysis, medicinal chemistry and natural products, including biosynthetic aspects.

Research articles published in OBC must show a significant advance on previously published work, or bring new thinking or results which will potentially have a strong impact in their field. Specific guidance for some areas of our scope is given below:

Organic synthesis - we welcome research in all areas of organic synthesis, including studies on small organic molecules and biomolecules, and articles which report purely synthetic work without biological data. Total or multistep syntheses should report new or improved strategies or methods, or a more efficient route to the target compound. Methodology studies should show a significant improvement on known methods. Research which extends known methodology to a different class of compounds is generally not suitable unless that class is significantly different to those on which that methodology has been used previously.

Medicinal chemistry - we welcome studies which report significant synthetic or bioorganic research which is directed towards medicinal chemistry applications. Studies which show routine syntheses accompanied by biological testing are generally not suitable for OBC.

Theoretical and computational studies - we welcome studies that report new models of reactivity, selectivity, bonding or structure, or new computational methods, that have relevance for the design of subsequent experiments (and that relevance should be clearly justified in the paper). Relevance is perhaps most clearly demonstrated by the description of testable predictions derived from the results of the reported theoretical work; the tests of these predictions could be contained in the same paper in which the predictions are described. Computational research that merely reproduces experimental data is not suitable for OBC

Natural products - we welcome articles that report new and interesting syntheses of natural products (see Organic Synthesis guidelines above). Isolation or identification studies are welcome when the compound being reported:

1) Has a novel structural class with unreported carbon skeleton, unusual functional groups or unusual modifications and/or
2) Displays a potent or unexpected biological activity or an unexpected mechanism of action.
Routine isolation studies are not suitable for OBC.

Sensors - we welcome articles describing sensors for ions and/or molecules provided that (a) they address targets and situations of practical relevance, and (b) they represent significant and demonstrable improvements on previous methodology. In particular, sensors for species in artificial surroundings (e.g. hydrophilic ions in organic solvents) will not usually be acceptable for publication.

The condensation of aromatic $\alpha$-diketones (benzils) with aromatic aldehydes (benzoin-type reaction) and chalcones (Stetter-type reaction) in DMF in the presence of catalytic ( $25 \mathrm{~mol} \%$ ) KOtBu is reported. Both types of umpolung processes proceed with good efficiency and complete chemoselectivity. On the basis of spectroscopic evidences (MS analysis) of plausible intermediates and literature reports, the occurrence of different ionic pathways have been evaluated to elucidate the mechanism of a model cross-benzoin-like reaction along with a radical route initiated by an electron-transfer process to benzil from the carbamoyl anion derived from DMF. This mechanistic investigation has culminated in a different proposal, supported by calculations and a trapping experiment, based on double electron-transfer to benzil with formation of the corresponding enediolate anion as key reactive intermediate. A mechanistic comparison between the activation modes of benzils in KOtBu-DMF and KOtBu-DMSO systems is also described.

## Introduction

$\mathrm{N}, \mathrm{N}$-Dimethylformamide is a common polar aprotic solvent but also an effective reagent, ligand or even catalyst employed in a number of fundamental reactions such as formylation, amidation, aminocarbonylation, cyanation, reduction, cycloaddition, dehydration, and $\mathrm{C}-\mathrm{H}$ activation. ${ }^{1}$ New roles are continuously discovered for DMF as demonstrated, for instance, by its recent use as component of novel multicomponent reactions. ${ }^{2}$ Interestingly, the involvement of DMF has been also reported for a series of base-promoted radical processes like the Mizoroki-Heck-type reaction, ${ }^{3}$ the $\alpha$ arylation of enolizable arylketones, ${ }^{4}$ and various intramolecular cyclizations. ${ }^{5}$ In the field of umpolung (polarity reversal) catalysis, DMF is a widely used solvent, while its active role has never been hypothesized to the best of our knowledge. The generation of acyl anion equivalents by the polarity reversal of carbonyl compounds through cyanide or N heterocyclic carbene (NHC) catalysis is today a well-established methodology to access target molecules by unconventional strategies as exemplified by classical benzoin and Stetter reactions. ${ }^{6}$ Typically, in the majority of the above umpolung

[^1]transformations the active species is catalytically generated through electron-pair-transfer steps. Only recently the opportunities given by single electron-transfer (ET) processes have been exploited to perform the NHC-catalyzed oxidation of aldehydes with $\mathrm{TEMPO}^{7}$ or oxygen, ${ }^{8}$ the $\beta, \beta$-coupling of nitroalkenes, ${ }^{9}$ the $\beta$-hydroxylation ${ }^{10}$ and annulation of enals. ${ }^{11}$ Remarkably, also the thiazolium-catalyzed benzoin condensation has been recently revisited in the light of an ETbased mechanism. ${ }^{12}$ The formation of a radical cation of the Breslow intermediate by the suitable choice of a singleelectron oxidant has been proposed for these transformations (Figure 1). Two-electron acceptors have been also utilized to oxidize the Breslow intermediate to the corresponding acylazolium ion for the production of carboxylic acids and esters. ${ }^{13}$

Fig 1 Umpolung reactions by electron-transfer processes: background and present work.

Here we describe the results of our study on the chemoselective cross-benzoin and Stetter-type reactions with aromatic $\alpha$-diketone donors promoted by the KOtBu-DMF system; we also report on the experimental evidences and theoretical calculations in support of a mechanism involving a two sequential ET process to the $\alpha$-diketone initiated by the carbamoyl anion of DMF, which produces an enediolate anion as key reactive species of umpolung catalysis (Figure 1).

## Results and Discussion

In a previous contribution we demonstrated the capability of methylsulfinyl (dimsyl) carbanion $\mathbf{A}$, generated by deprotonation of the DMSO solvent with KOtBu, to induce the polarity reversal of diaryl $\alpha$-diketones (benzils) $\mathbf{1}$ in chemoselective cross-benzoin-type reactions with aromatic aldehydes 2 leading to benzoylated benzoins 3 through a formal sequence of nucleophilic C -aroylation and electrophilic O-aroylation steps (Scheme 1). ${ }^{14}$ In our mechanistic interpretation, dimsyl anion A served as Lewis base (LB) and anion-stabilizing group to produce the reactive carbanion intermediate III(A) (aroyl anion equivalent) in analogy with cyanide B catalysis. ${ }^{15}$ The same dimsyl anion A proved to be effective in Stetter-like reactions of $\mathbf{1}$ with chalcones 4 affording 2-benzoyl-1,4-diones 5 as products of double Caroylation (eqn. a). ${ }^{16}$

Scheme 1 General ionic pathway for the polarity reversal of benzils 1 leading to benzoylated benzoins 3; Stetter-like reaction of $\mathbf{1}$ with chalcones $\mathbf{4}$ mediated by the dimsyl anion $\mathbf{A}$ (eqn. $a$ ).

Due to the known formation of carbamoyl anions of type C from N,N-disubstituted formamides with strong bases, ${ }^{17}$ the use of DMF was considered in the present study with the aim to eventually provide an improved protocol towards compounds $\mathbf{3}$ and 5 and, at the same time, better elucidate the mechanistic details of our proposal. Hence, the model reaction of benzil 1a with o-chlorobenzaldehyde 2a was performed in anhydrous DMF (argon atmosphere) in the presence of KOtBu ( 25 mol\%); gratifyingly, the target adduct 3aa was obtained in
almost quantitative yield after 30 minutes (Table 1, entry 1). A decrease in the amount of KOtBu ( $10 \mathrm{~mol} \%$ ) led to a lower yield of 3aa (entry 2), and exposure of the reaction mixture to air significantly affected the reaction rate (entry 3). The use of equimolar KOtBu produced a complex reaction mixture where 3aa could be detected in only trace amounts (entry 4). Other bases such as $\mathrm{NaOtBu}, \mathrm{NaH}$ and DBU were also applicable furnishing, however, lower yields of 3aa (entries 5-7). The weaker base $\mathrm{Et}_{3} \mathrm{~N}$ was completely inefficient (entry 8). Also, no product formation was observed in THF, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and NMP, while a poor yield of 3aa (7\%) was detected in DMA (entries 912). To unequivocally prove the active role of DMF, the $\mathbf{1 a} \mathbf{/ 2 a}$ coupling was performed in THF with increasing amounts of anhydrous DMF detecting a direct correlation between the yield of 3aa and the added quantity of DMF (entries 13-14).

${ }^{a}$ Reaction Conditions: benzil ( 0.50 mmol ), o-chloro benzaldehyde ( 0.50 mmol ), anhydrous solvent ( 1.0 mL ), and the stated amount of base. ${ }^{b}$ Isolated yield. ${ }^{c}$ Reaction conducted under open air. ${ }^{d}$ Reaction performed in the presence of 1 equiv. of anhydrous DMF. ${ }^{e}$ Reaction performed in the presence of 10 equiv. of anhydrous DMF.

The cross-benzoin-like reaction promoted by KOtBu-DMF was applied to various $\alpha$-diketones $\mathbf{1}$ and aromatic aldehydes 2 producing results similar to those previously observed in DMSO (Table 2; selected experiments are reported). ${ }^{14}$ Indeed, higher coupling efficiencies were achieved with electronwithdrawing groups installed on either $\alpha$-diketone $\mathbf{1}$ or aldehyde 2; interesting anomaly of the KOtBu-DMF system was, however, the general inertness of 4,4'-dimethylbenzil 1d toward carboligations with aldehydes 2 (entry 10).

${ }^{a}$ Reaction Conditions: 1 ( 1.00 mmol ), 2 ( 1.00 mmol ), KOtBu ( $25 \mathrm{~mol} \%$ ), and anhydrous DMF ( 2.0 mL ). ${ }^{b}$ Isolated yield. ${ }^{c}$ Isomeric mixture (see the ESI for details). ${ }^{d}$ Recovered unreacted 1d and 2a.

Stetter-like reactions of $\alpha$-diketones $\mathbf{1}$ with chalcones 4 were also examined in DMF to prepare the valuable 1,4-diones 5 (Table 3; selected examples). Couplings were optimized with an excess of 1 (2 equiv.) and equimolar KOtBu but, in general, a lower level of reaction efficiency was detected compared to DMSO-KOtBu. ${ }^{16}$ Again, the substrate 1d proved to be completely ineffective with the DMF-based activation system (entry 8).

${ }^{a}$ Reaction Conditions: $\mathbf{1}(1.00 \mathrm{mmol}), \mathbf{2}(0.50 \mathrm{mmol})$, KOtBu ( $25 \mathrm{~mol} \%$ ), and anhydrous DMF ( 2.0 mL ). ${ }^{b}$ Isolated yield. ${ }^{c}$ Diastereomeric mixture.

The picture arising from the ESI-MS analyses of the model $\mathbf{1 a} \mathbf{2} \mathbf{2 a}$ coupling promoted by the KOtBu-DMF and KOtBuDMSO systems led us to suppose a different role for the dimsyl and carbamoyl anions A and C with possible mechanistic implications. Spectra obtained in both full-scan and MS/MS modes provided, in fact, direct evidence of the anion III(A) ${ }^{14}$ ( $\mathrm{m} / \mathrm{z} 287$ ) but not of the corresponding reactive species III(C) (Scheme 2). Therefore, the precursor 7 of the aroyl anion
equivalent III(C) was suitably prepared by standard chemistry starting from benzaldehyde $\mathbf{2 g}$ (eqn. $a$ ). When $\mathbf{7}$ was added to the DMF solution of o-chlorobenzaldehyde $\mathbf{2 a}$ in the presence of KOtBu (1 equiv.) the only isolable product was the adduct 8 (22\%; eqn. b), thus indicating the lack of catalyst turnover with $\mathbf{C}$ and the general inefficacy of this promoter. In a control experiment, the 0 -aroylmandelonitrile $9,{ }^{18}$ that is the precursor of the aroyl anion equivalent III(B) (Scheme 1), reacted with 2a (equimolar KOtBu, DMF, RT) furnishing the target cross-benzoin product 3aa in satisfactory $65 \%$ yield (Scheme 2, eqn. c).

Scheme 2 MS/MS spectrum of III(A) ( $\mathrm{m} / \mathrm{z} 287$ ); proof that intermediate III(C) is not involved in the $\mathbf{1 a} \mathbf{/ 2} \mathbf{a}$ coupling (eqns. $a, b$ ); control experiment (eqn. $c$ ).

At the beginning of this study, we were aware of the mechanistic proposal that Lund and co-workers suggested to explain the set of products observed in the homocoupling reaction of benzil 1a in DMF with stoichiometric KOtBu. ${ }^{19}$ In that study it was hypothesized the crucial role for the umpolung of 1a of the anion $\mathbf{D}$, which is supposed to be produced after a sequence of reactions involving the initial benzilic rearrangement of $\mathbf{1 a}$ to the benzilic ester $\mathbf{1 0}$ followed by formation of benzophenone 11 through a redox process with 1a (Scheme 3). According to that proposal, it could be envisaged that the anion $\mathbf{D}$ could function as the active Lewis base (LB) in the 1a/2a cross-coupling as well. To verify this hypothesis, the precursor 12 of the anion $\mathbf{D}$ was readily synthesized from benzophenone 11 ( $72 \%$, eqn. $a$ ); then, a solution of deprotonated 12 ( $\mathrm{NaH}, \mathrm{THF}$ ) was slowly added to the mixture of 1a and $\mathbf{2 a}$ in NMP observing, however, the complete absence of the coupling product 3aa (eqn. b).

Scheme 3 Proposed mechanism (Ref. 19) for the homocoupling of benzil 1a mediated by the KOtBu-DMF system; proof of the inability of $\mathbf{D}$ to promote the $\mathbf{1 a} \mathbf{2} \mathbf{2 a}$ coupling (eqns. $a, b$ ).

In the search for the existence of plausible intermediates of the ionic pathway depicted in Scheme 1, a real-time monitoring of the model 1a/2a coupling was conducted by ESIMS and NMR analyses. Both techniques confirmed a short reaction time (ca. 15 min ) for this transformation; while the identification of any intermediate failed by proton and carbon NMR analysis, ESI(-)-MS spectra showed the species E at $m / z$ 90 as a possible player (Scheme 1, Figure 3, and Figure S1). The Lewis base $\mathbf{E}$ could be formed by addition to DMF of the hydroxyl anion generated by deprotonation of adventitious water with KOtBu. Intriguingly, MS spectra of the 1a/2a coupling in DMA and NMP solvents displayed a very low intensity peak of the DMA/OH adduct ( $m / z 121$ ) and the absence of peak for the NMP/OH species ( $m / z 116$ ), ${ }^{20}$ in full agreement with the observed trend of reaction conversions in those solvents (Table 1, entries 11-12). Significantly, the peak corresponding to the isobaric species I-III(E) could be detected at $m / z 300$ (or $m / z 307$ for DMF- $d_{7}$ ) and fragmented (Figures 23). In principle, from the analysis of the MS/MS spectrum it would be possible to distinguish among the isobaric intermediates I-III(E). The observed fragmentations were attributed to the loss of $\mathrm{CH}_{2} \mathrm{O}_{2}$ with formation of the ion at $\mathrm{m} / \mathrm{z} 254$ and to the formation of the benzoate anion at $\mathrm{m} / \mathrm{z}$ 121, ascription confirmed also in the experiments carried out using DMF- $d_{7}$ (Figure S2). This latter evidence, in particular, supported the structure III(E), where a release of the benzoate ion may easily take place.

Fig. $2 \mathrm{MS} / \mathrm{MS}$ of the isobaric intermediates I-III(E) in DMF ( $\mathrm{m} / \mathrm{z} 300$ ) and related signature fragments ( $\mathrm{m} / \mathrm{z} 254$ and 121).

Based on these premises and literature reports on different activities of hydrated DMF, ${ }^{21}$ we carried out calculations to ascertain whether the anion $\mathbf{E}$ could be productively involved in the catalytic cycle of Scheme 1 . The initial addition of $\mathbf{E}$ to benzil 1a giving I(E) was found to be endergonic by 3.4 kcal $\mathrm{mol}^{-1}$ with an energy barrier of $9.1 \mathrm{kcal} / \mathrm{mol}$ (Figure 3 ). Nevertheless, the rearrangement of $I(E)$ to the postulated reactive intermediate $\operatorname{III}(E)$ through the epoxide II(E) (endergonic by $13.3 \mathrm{kcal}^{\mathrm{mol}}{ }^{-1}$ ) was found to be an overall endergonic process ( $31.4 \mathrm{kcal}^{\mathrm{mol}}{ }^{-1}$ ), thus indicating this mechanistic hypothesis very unlikely and confined to the peculiar gas phase conditions of the MS experiment.

Fig. 3 Calculated $\left(\Delta \Delta \mathrm{G} \mathrm{kcal} \mathrm{mol}^{-1}\right)$ energy profile of the ionic pathway of Scheme 1 with the postulated promoter $\mathbf{E}[\mathrm{M} 06 / / 6-31+\mathrm{G}(\mathrm{d}, \mathrm{p})$ level using the PCM continuum model; see ESI for details].

As anticipated, the KOtBu-DMF system has been reported to efficiently initiate various free radical processes. ${ }^{3-5}$ The carbamoyl radical $\mathbf{F}$ is supposed to be generated by single electron-transfer from the carbamoyl anion $\mathbf{C}$ to DMF with concomitant formation of the radical anion $\mathbf{G}$ (Scheme 4). ${ }^{4,5,22}$

Scheme 4. Supposed mechanism for formation of the carbamoyl radical F.

Indeed, in 2009 Sliwka and co-workers observed the generation of radical intermediates in basic DMF solutions via EPR analysis, although the structures of these intermediates were not identified. ${ }^{23}$ In our study we also observed a weak uninterpretable EPR signal in the solution of KOtBu-DMF (Figure 4, solid). Intriguingly, the solution became EPR silent after the addition of benzil 1a. Only when aldehyde 2a was added an EPR signal emerged (Figure 4, dashed) with a g value of 2.0017 and without hyperfine structure (see below and Scheme 5 for a tentative interpretation). Moreover, its intensity reached a maximum after ca. 7 minutes (Figure S3) and then diminished, likely indicating that the radical degraded or was consumed in a subsequent reaction.

Fig. 4 EPR spectra obtained from DMF solutions containing KOtBu ( 0.125 M ) (solid) and KOtBu (0.125 M), benzil 1a (0.5 M), aldehyde 2a ( 0.5 M ) (dashed).

The same sequence of EPR experiments was repeated in the presence of the radical trap $\alpha$-phenyl-N-tert-butyl nitrone (PBN). While the KOtBu-DMF solution produced a weak signal of difficult interpretation (Figure 5 black line), ${ }^{24}$ addition of benzyl 1a resulted in a strong and well-defined signal, which consisted of a triplet of doublets (Figure 5 red line). According to literature data ${ }^{25}$ and on the basis of the obtained hyperfine splitting coupling constants $\left(a_{N}=13.3\right.$ gauss and $a_{H}=1.77$ gauss), the EPR signal was reasonably attributed to the spin adduct of the benzil anion radical $\mathbf{V}$ with PBN (Scheme 5). ${ }^{26}$

Fig. 5 EPR spectrum of a DMF solution containing KOtBu ( 0.125 M ) and PBN ( 0.5 M ) (black line). EPR spectrum of the paramagnetic adduct [PBN-benzil anion radical V] ${ }^{\text { }}$ obtained upon addition of benzil 1a ( 0.5 M ) (red line).

Furthermore, the same EPR spectrum for the trapped radical anion V was also detected with a mixture of KOtBu-DMF, benzil 1a, and aldehyde 2a. Assuming that the use of an excess of spin trap warrants a constant amount of trapped species, ${ }^{27}$ the intensities of the EPR signal of $\mathbf{V}$ in the presence or absence of $\mathbf{2 a}$ were compared. Interestingly, it was noticed that the addition of aldehyde $\mathbf{2 a}$ produced an appreciable lowering of signal intensity over the time (Figure S4), thus suggesting a competition between 2a and PBN for the radical anion V. Overall, these results are consistent with the possible
generation of the benzil anion radical $\mathbf{V}$ via single ET from the carbamoyl anion C, followed by its addition to the aldehyde $\mathbf{2}$ to give the oxygen radical VI, which then rearranges to the radical reducing species VIII through the cyclic intermediate VII (Scheme 5). In agreement with this proposal, the EPR signal of Figure 4 (dashed line) could be assigned to one of the intermediates VI-VIII; these are all quite long-lived radicals that do not present hyperfine coupling with the unpaired electron. On the other hand, the benzil anion radical $\mathbf{V}$ has been described as a highly unstable and short-lived radical species, ${ }^{26}$ thus explaining the absence of signal in the experiment carried out without the spin trap.

Scheme 5 Plausible radical pathway for the cross-benzoin-like reaction of benzils $\mathbf{1}$ with aldehydes 2.

With this information in hand, we turned back to the preparative 1a/2a coupling and, surprisingly, we found that it was inhibited to a very limited extent by the addition (3 equiv.) of the radical scavengers TEMPO (3aa: 87\%) and PBN (3aa: $81 \%$ ) with no clear evidence of trapped products (see the ESI). This result seems to indicate that the proposed radical pathway could only minimally contribute to the overall process of 3aa synthesis. Therefore, as a further possibility we considered the potential formation of the enediolate anion IX by two sequential ET steps from the carbamoyl anion $\mathbf{C}$ to benzil 1a (Scheme 6). It is worth noting that intermediates of types IX have been previously generated by reduction of benzils with metal alkali, ${ }^{28} \mathrm{Sml}_{2},{ }^{29}$ and by electrochemical methods. ${ }^{30}$ The spontaneous disproportionation of the benzil anion radical V into benzil 1a and the enediolate anion IX has been also proposed. ${ }^{31}$ Accordingly, we calculated the energetics of the benzil $\mathbf{1 a}$ /benzaldehyde $\mathbf{2 g}$ coupling by the supposed dianionic pathway of Scheme 6 . $^{32}$ The free energy stabilization of the initial two electron-transfer process from $\mathbf{C}$ to 1a was investigated by treating reactants and products
separately. Following this model, ${ }^{33}$ the first ET to form the benzil anion radical $\mathbf{V}$ was found to be exergonic by 2.4 kcal $\mathrm{mol}^{-1}$, while the second ET furnishing the reactive enediolate anion IX was endergonic by $23.0 \mathrm{kcal}^{\mathbf{k}} \mathrm{mol}^{-1}$. In parallel, the disproportionation of the benzil anion radical $\mathbf{V}$ into benzil 1a and the dianion IX was also calculated using the same thermodynamic ET model and found to be endergonic by $26.3 \mathrm{kcal}^{2} \mathrm{~mol}^{-1}$.

Scheme 6 Hypothesized dianionic pathway for the cross-benzoin-like reaction of benzils 1 with aldehydes 2.

It is important to stress that these are only qualitative values that can be quite different from the experimental ones; it is well known, in fact, that this model suffers from the difficult identification of a realistic donor-acceptor complex. ${ }^{33}$ The subsequent coupling of dianion IX with benzaldehyde $\mathbf{2 g}$ to form the cyclic intermediate $\mathbf{X I}$ through the first adduct $\mathbf{X}$ proceeded with an energy barrier of $17.6 \mathrm{kcal}^{\prime} \mathrm{mol}^{-1}$ (see the energy profile of Figure 6). Remarkably, the final two ET step from XI to 1a forming the dianion IX and the product 3ag resulted to be exergonic by $18.5 \mathrm{kcal}^{\mathrm{mol}}{ }^{-1}$, thus supporting the hypothesis of a chain process promoted by the regenerated dianion IX.

Fig. 6 Calculated ( $\Delta \Delta \mathrm{G} \mathrm{kcal} \mathrm{mol}^{-1}$ ) energies for the dianionic pathway of $\mathbf{1 a} / \mathbf{2 g}$ coupling in DMF [M06//6-31+G(d,p) level using the PCM continuum model; see ESI for details].

Since lower absolute values of reduction potentials are expected for benzils 1 displaying electron-withdrawing groups, the proposed mechanistic hypothesis appeared to be consistent with the reactivity order observed in the substrate scope study (Table 2, entries 1-9 vs. entry 10).
In order to confirm our assumption that the enediolate anion IX is the key intermediate of the $\mathbf{1 / 2}$ condensation with the KOtBu-DMF system, a trapping experiment was attempted by quenching the duly deaerated (Ar atmosphere) deep-blue DMF solution of benzil 1a and KOtBu ( $25 \mathrm{~mol} \%$ ) with an excess ( 5 equiv.) of acetic anhydride. Very satisfyingly, the expected O,O'-diacetyl-1,2-diphenylethen-1,2-diol 13 could be recovered in $8 \%$ yield with almost exclusive ( $Z$ )-configuration (Scheme 7, eqn. a). Of note, the presence of oxygen in the reaction mixture precluded the isolation of 13 , thus accounting for the observed low reaction rate of the $\mathbf{1 / 2}$ coupling under aerated conditions (Table 1, entry 3); on the other hand, the oxidation by oxygen of the enediolate anion IX to benzil has been reported as a fast reaction. ${ }^{28}$ A crossover experiment was also performed to exclude the possible generation of dianion IX by deprotonation of eventually formed benzoin. Accordingly, 1a and 2a were reacted in the presence of the substituted benzoin 14 (1 equiv.) observing the formation of the target adduct 3aa without any evidence of the crossover product 3ba (eqn. b).

Scheme 7. Trapping of the postulated enediolate anion IX and crossover experiment.

At this stage of our study, we could not exclude a similar dianionic pathway for the KOtBu-DMSO system as well. ${ }^{14}$ The initial two ET process from benzil 1a leading to the enediolate IX was calculated to be endergonic by $50.5 \mathrm{kcal}^{\mathrm{kmol}}{ }^{-1}$, being the first ET endergonic by $11.2 \mathrm{kcal}^{\mathrm{k}} \mathrm{mol}^{-1}$. Although a case-bycase approach should be considered depending on the stereoelectronic features of the diketone and aldehyde substrates, these preliminary calculations indicated that the ET-based mechanism is a low probability activation mode of benzil in DMSO. Hence, the ionic route mediated by dimsyl carbanion A (Scheme 1) was calculated for the activation of 1a resulting in the energy profile of Figure 7. The first adduct $\mathbf{I}(\mathbf{A})$ was found $17.3 \mathrm{kcal}^{\prime} \mathrm{mol}^{-1}$ lower in energy than the reactants with an activation energy of $5.3 \mathrm{kcal}^{\prime} \mathrm{mol}^{-1}$. The rearrangement
to form the epoxide $\boldsymbol{I I}(\mathbf{A})$ and then the carbanion $\boldsymbol{I I}(\mathbf{A})$ proceeded with energy barriers of 8.6 and $10.4 \mathrm{kcal}^{1} \mathrm{~mol}^{-1}$, respectively. In situations such as this, it is likely that the forward reaction leading to the product $\mathbf{3}$ would be favored in a competition with the reverse reaction dissociating back to the separated reactants $\mathbf{1}$ and $\mathbf{A}$.

Fig. 7 Calculated ( $\Delta \Delta \mathrm{G} \mathrm{kcal} \mathrm{mol}^{-1}$ ) energy profile of the ionic pathway of Scheme 1 with the postulated promoter $A$ (dimsyl anion) [M06//6-31+G(d,p) level using the PCM continuum model; see ESI for details].

## Conclusions

In summary, we have developed benzoin- and Stetter-like reactions of $\alpha$-diketone donors with aromatic aldehyde and chalcone acceptors, respectively, mediated by KOtBu-DMF. Condensations proceeded under mild conditions with good efficiency and high level of chemoselectivity. From a mechanistic point of view, following the evaluation of plausible ionic and radical routes, the experimental results and calculations supported a dianionic pathway involving the formation of the enediolate anion derived form benzil as the key step. This intermediate is proposed to be generated by double electron-transfer to benzil from the carbamoyl anion of DMF that is the crucial initiator of the umpolung process. ${ }^{22}$ This activation mode of benzils resulted to be different from that operating with the KOtBu-DMSO system, for which calculations suggested the ionic route also proposed for cyanide catalysis. It is important to stress, however, that the formulation of a more complex mechanistic picture that unites polar and radical steps cannot be excluded for both KOtBuDMF and KOtBu-DMSO systems and should be evaluated on the basis of the substitution pattern of the donor/acceptor substrates. This aspect of our mechanistic proposal will be clarified in future work and complemented by further investigation on new modes of reactivity enabled by ET processes to benzils under homogeneous and heterogeneous conditions.

## Experimental Section

## General Information

Potassium tert-butoxide was purified by sublimation (200-220 ${ }^{\circ} \mathrm{C}$ at 1 mmHg ) before utilization. Reactions were monitored by TLC on silica gel $60 \mathrm{~F}_{254}$ with detection by charring with phosphomolybdic acid. Flash column chromatography was performed on silica gel 60 (230-400 mesh). ${ }^{1} \mathrm{H}(300 \mathrm{MHz}),{ }^{13} \mathrm{C}$ ( 75 MHz ), and ${ }^{19} \mathrm{~F}(282 \mathrm{MHz}$ ) NMR spectra were recorded in $\mathrm{CDCl}_{3}$ solutions at room temperature. Peaks assignments were aided by ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY and gradient-HMQC experiments. ESI-MS routine analyses were performed in positive ion mode with samples dissolved in 10 mM solution of ammonium formate in 1:1 $\mathrm{MeCN} / \mathrm{H}_{2} \mathrm{O}$. For accurate mass measurements, the compounds were detected in positive ion mode by HPLC-Chip Q/TOF-MS (nanospray) analysis using a quadrupole, a hexapole, and a time-of-flight unit to produce spectra. Elemental analyses were performed with FLASH 2000 Series CHNS/O analyzer (Thermofisher Scientific). Liquid aldehydes were freshly distilled before their utilization. Diketones 1a, 1b, $\mathbf{1 d}$, chalcones $\mathbf{4 a - c}$ are commercially available compounds. Diketone 1c, ${ }^{34}$ chalcones $4 d-\mathbf{f}^{35}$ and compound $\mathbf{9}^{18}$ were synthetized as described. Spectroscopic data of compounds

 were identical to those previously reported.

## Optimization of the model cross-benzoin-type reaction of

 benzil 1a with o-chlorobenzaldehyde 2a (Table 1).Entries 1-2. To a vigorously stirred solution of benzil 1a (105 $\mathrm{mg}, 0.50 \mathrm{mmol}$ ) and o-chlorobenzaldehyde 2a ( $56 \mu \mathrm{~L}, 0.50$ mmol ) in anhydrous DMF ( 1 mL ), the stated amount of potassium tert-butoxide (mol\% based on 1a) was added in one portion. The mixture was degassed under vacuum and saturated with argon (by an argon-filled balloon) three times. The reaction mixture was stirred at room temperature for the stated reaction time, then diluted with $\mathrm{H}_{2} \mathrm{O}(5 \mathrm{~mL})$ and extracted with $\mathrm{Et}_{2} \mathrm{O}(2 \times 25 \mathrm{~mL})$; the combined organic phases were dried ( $\mathrm{Na}_{2} \mathrm{SO}_{4}$ ), concentrated, and eluted from a column of silica gel with 20:1 cyclohexane-AcOEt to give 3aa.
Entry 3. To a vigorously stirred solution of benzil 1 a ( 105 mg , 0.50 mmol ) and o-chlorobenzaldehyde 2a ( $56 \mu \mathrm{~L}, 0.50 \mathrm{mmol}$ ) in anhydrous DMF ( 1 mL ), potassium tert-butoxide ( 14 mg , 0.125 mmol ) was added in one portion. The reaction mixture was stirred under open air at room temperature for 16 h , then diluted with $\mathrm{H}_{2} \mathrm{O}(5 \mathrm{~mL})$ and extracted with $\mathrm{Et}_{2} \mathrm{O}(2 \times 25 \mathrm{~mL})$; the combined organic phases were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, concentrated, and eluted from a column of silica gel with 20:1 cyclohexane-AcOEt to give 3aa.
Entries 4-8. To a vigorously stirred solution of benzil 1a (105 $\mathrm{mg}, 0.50 \mathrm{mmol}$ ) and o-chlorobenzaldehyde 2a ( $56 \mu \mathrm{~L}, 0.50$ mmol ) in anhydrous DMF ( 1 mL ), the stated amount of base ( $25 \mathrm{~mol} \%$ based on 1a) was added in one portion. The mixture was degassed under vacuum and saturated with argon (by an argon-filled balloon) three times. The reaction mixture was stirred at room temperature for the stated reaction time, then diluted with $\mathrm{H}_{2} \mathrm{O}(5 \mathrm{~mL})$ and extracted with $\mathrm{Et}_{2} \mathrm{O}(2 \times 25 \mathrm{~mL})$;
the combined organic phases were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, concentrated, and eluted from a column of silica gel with 20:1 cyclohexane-AcOEt to give 3aa.
Entries 9-12. To a vigorously stirred solution of benzil 1a (105 $\mathrm{mg}, 0.50 \mathrm{mmol}$ ) and o-chlorobenzaldehyde 2a (56 $\mu \mathrm{L}, 0.50$ mmol ) in the stated anhydrous solvent ( 1 mL ), potassium tertbutoxide ( $14 \mathrm{mg}, 0.125 \mathrm{mmol}$ ) was added in one portion. The mixture was degassed under vacuum and saturated with argon (by an argon-filled balloon) three times. The reaction mixture was stirred at room temperature for the stated reaction time, then diluted with $\mathrm{H}_{2} \mathrm{O}(5 \mathrm{~mL})$ and extracted with $\mathrm{Et}_{2} \mathrm{O}(2 \times 25$ $\mathrm{mL})$; the combined organic phases were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, concentrated, and eluted from a column of silica gel with 20:1 cyclohexane-AcOEt to give 3aa. Product 3aa was detected and isolated just in the case of entry 12.
Entries 13-14. To a vigorously stirred solution of benzil 1a (105 $\mathrm{mg}, 0.50 \mathrm{mmol}$ ), o-chlorobenzaldehyde 2a ( $56 \mu \mathrm{~L}, 0.50 \mathrm{mmol}$ ) and the stated amount of anhydrous DMF in anhydrous THF (1 mL ), potassium tert-butoxide ( $14 \mathrm{mg}, 0.125 \mathrm{mmol}$ ) was added in one portion. The mixture was degassed under vacuum and saturated with argon (by an argon-filled balloon) three times. The reaction mixture was stirred at room temperature for 16 $h$, then diluted with $\mathrm{H}_{2} \mathrm{O}(5 \mathrm{~mL})$ and extracted with $\mathrm{Et}_{2} \mathrm{O}(2 \times 25$ $\mathrm{mL})$; the combined organic phases were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, concentrated, and eluted from a column of silica gel with 20:1 cyclohexane-AcOEt to give 3aa.

General procedure for the cross-benzoin-type reactions of $\alpha$ diketones 1 with aldehydes 2 mediated by KOtBu-DMF (Table 2).

To a vigorously stirred solution of $\alpha$-diketone $1(1.00 \mathrm{mmol})$ and aldehyde 2 ( 1.00 mmol ) in anhydrous DMF ( 2 mL ), potassium tert-butoxide ( $28 \mathrm{mg}, 0.25 \mathrm{mmol}$ ) was added in one portion. The mixture was degassed under vacuum and saturated with argon (by an argon-filled balloon) three times. The reaction mixture was stirred at room temperature until complete disappearance or best conversion of reactants was detected (TLC analysis, $\sim 1-16 \mathrm{~h})$, then diluted with $\mathrm{H}_{2} \mathrm{O}(10 \mathrm{~mL})$ and extracted with $\mathrm{Et}_{2} \mathrm{O}(2 \times 50 \mathrm{~mL})$. The combined organic phases were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, concentrated, and eluted from a column of silica gel with the suitable elution system to give the benzoylated benzoins 3 .

1-(2-Chlorophenyl)-2-oxo-2-phenylethyl benzoate (3aa).
Column chromatography with 20:1 cyclohexane-AcOEt afforded 3aa ${ }^{14 \mathrm{a}}$ (333 mg, 95\%) as a white foam. ${ }^{1} \mathrm{H}$ NMR (300 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=8.12 \quad-8.07(\mathrm{~m}, 2 \mathrm{H}, \mathrm{Ar}), 8.02-7.98(\mathrm{~m}, 2 \mathrm{H}, \mathrm{Ar})$, 7.60-7.40 (m, $8 \mathrm{H}, \mathrm{Ar}$ ), 7.44 ( $\mathrm{s}, 1 \mathrm{H}, \mathrm{H}-1$ ), 7.36-7.24 (m, $2 \mathrm{H}, \mathrm{Ar}$ ); ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR $\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=193.3,165.8,134.9,134.4$, 134.2, 133.8, 133.4, 131.8, 130.8, 130.4, 130.2, 130.1, 130.0, 129.9, 129.5, 129.2, 129.0, 128.8, 128.4, 127.6, 74.0.

1-(2-Methoxyphenyl)-2-oxo-2-phenylethyl benzoate (3ab).
Column chromatography with 20:1 cyclohexane-AcOEt afforded $3 \mathbf{a b}^{14 \mathrm{~b}}$ (311 $\mathrm{mg}, 90 \%$ ) as a white amorphous solid. ${ }^{1} \mathrm{H}$ NMR (300 MHz, $\mathrm{CDCl}_{3}$ ): $\delta=8.15-8.07$ (m, $2 \mathrm{H}, \mathrm{Ar}$ ), 8.08-7.99 (m, $2 \mathrm{H}, \mathrm{Ar}$ ), 7.59 ( $\mathrm{s}, 1 \mathrm{H}, \mathrm{H}-1$ ), 7.58-7.49 (m, $2 \mathrm{H}, \mathrm{Ar}$ ), 7.49-7.38
(m, 5 H, Ar), 7.38-7.30 (m, $1 \mathrm{H}, \mathrm{Ar}), 7.01-6.90$ (m, $2 \mathrm{H}, \mathrm{Ar}), 3.92$ (s, $3 \mathrm{H}, \mathrm{CH}_{3}$ ); ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\} \mathrm{NMR}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=194.0,166.2$, 156.7, 134.7, 133.4, 133.2, 130.8, 130.0, 129.9, 129.7, 128.7, $128.5,128.35,122.3,121.2,111.3,71.6,55.8$.

## 2-Oxo-2-phenyl-1-(o-tolyl)ethyl benzoate (3ac).

Column chromatography with 12:1 cyclohexane-AcOEt afforded 3ac ${ }^{14 \mathrm{a}}$ ( $155 \mathrm{mg}, 47 \%$ ) as a white amorphous solid. ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=8.14-8.08(\mathrm{~m}, 2 \mathrm{H}, \mathrm{Ar}), 7.92-7.86$ (m, 2 H, Ar), 7.60-7.7.37 (m, 8 H, Ar), 7.32-7.14 (m, 2 H), 7.29 (s, $1 \mathrm{H}, \mathrm{H}-1), 2.50\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right) ;{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR $\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta$ $=194.2,166.1,137.3,135.0,133.4,133.3,132.3,131.3,130.0-$ 128.4 (11 C), 126.7, 75.6, 19.5.

## 1-(3-Bromophenyl)-2-oxo-2-phenylethyl benzoate (3ad).

Column chromatography with 20:1 cyclohexane-AcOEt afforded 3ad ${ }^{14 \mathrm{~b}}$ ( $363 \mathrm{mg}, 92 \%$ ) as a white amorphous solid. ${ }^{1} \mathrm{H}$ NMR (300 MHz, $\mathrm{CDCl}_{3}$ ): $\delta=8.16-8.07(\mathrm{~m}, 2 \mathrm{H}, \mathrm{Ar}), 8.03-7.94$ (m, $2 \mathrm{H}, \mathrm{Ar}), 7.76-7.69$ (m, $1 \mathrm{H}, \mathrm{Ar}), 7.62-7.52$ (m, $2 \mathrm{H}, \mathrm{Ar}$ ), 7.517.38 (m, $6 \mathrm{H}, \mathrm{Ar}$ ), 7.30-7.24 (m, $1 \mathrm{H}, \mathrm{Ar}$ ), 7.04 (s, $1 \mathrm{H}, \mathrm{H}-1$ ); ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR $\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=193.2,165.8,135.89,134.4$, 133.8, 133.5, 132.5, 131.5, 130.6, 130.0, 129.3, 129.1, 128.8, 128.5, 127.2, 123.1, 76.9.

1-(4-Chlorophenyl)-2-oxo-2-phenylethyl benzoate (3ae).
Column chromatography with 20:1 cyclohexane-AcOEt gave first 2-(4-chlorophenyl)-2-oxo-1-phenylethyl benzoate 3'ae ${ }^{14 a}$ ( $59 \mathrm{mg}, 17 \%$ ) as a white amorphous solid. ${ }^{1} \mathrm{H}$ NMR ( 300 MHz , $\left.\mathrm{CDCl}_{3}\right): \delta=8.14-8.08(\mathrm{~m}, 2 \mathrm{H}, \mathrm{Ar}), 7.94-7.90(\mathrm{~m}, 2 \mathrm{H}, \mathrm{Ar}), 7.60-$ $7.50(\mathrm{~m}, 2 \mathrm{H}, \mathrm{Ar}), 7.48-7.32(\mathrm{~m}, 8 \mathrm{H}, \mathrm{Ar}), 7.03(\mathrm{~s}, 1 \mathrm{H}, \mathrm{H}-1) ;{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=192.6,166.0,133.5,130.2-128.5$ (17 C), 77.9. Eluted second was $3 \mathbf{a e}^{14 \mathrm{a}}(266 \mathrm{mg}, 76 \%)$ as a white amorphous solid. ${ }^{1} \mathrm{H} \mathrm{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=8.14-8.06(\mathrm{~m}$, $2 \mathrm{H}, \mathrm{Ar}), 8.00-7.94$ (m, $2 \mathrm{H}, \mathrm{Ar}), 7.60-7.32$ (m, $10 \mathrm{H}, \mathrm{Ar}$ ), 7.06 ( s , $1 \mathrm{H}, \mathrm{H}-1) ;{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=193.4$, 165.9, 135.4, 134.5, 133.7, 133.5, 130.0-128.4 (14 C), 77.3.

1-(2,3-Dichlorophenyl)-2-oxo-2-phenylethyl benzoate (3af). Column chromatography with 50:1 cyclohexane-AcOEt afforded 3af ${ }^{14 a}$ ( $308 \mathrm{mg}, 80 \%$ ) as a white amorphous solid. ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=8.12-8.04(\mathrm{~m}, 2 \mathrm{H}, \mathrm{Ar}), 8.02-7.94$ (m, $2 \mathrm{H}, \mathrm{Ar}$ ), 7.62-7.53 (m, $2 \mathrm{H}, \mathrm{Ar}$ ), 7.61 ( $\mathrm{s}, 1 \mathrm{H}, \mathrm{H}-1$ ), 7.52-7.39 $(\mathrm{m}, 6 \mathrm{H}, \mathrm{Ar}), 7.22(\mathrm{t}, 1 \mathrm{H}, \mathrm{J}=8.0 \mathrm{~Hz}, \mathrm{Ar}) ;{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\} \mathrm{NMR}(75 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right): \delta=193.2,165.8,134.5,134.2,133.8,132.4,131.7$, 130.3, 129.1-128.1 (12 C), 74.5.

## 2-Oxo-1,2-diphenylethyl benzoate (3ag).

Column chromatography with 10:1 cyclohexane-AcOEt afforded $\mathbf{3 a g}{ }^{14 \mathrm{a}}$ ( $161 \mathrm{mg}, 51 \%$ ) as a white amorphous solid. ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=8.14-8.08(\mathrm{~m}, 2 \mathrm{H}, \mathrm{Ar}), 8.02-7.94$ (m, $2 \mathrm{H}, \mathrm{Ar}$ ), 7.60-7.50 (m, $4 \mathrm{H}, \mathrm{Ar}$ ), 7.48-7.34 (m, $7 \mathrm{H}, \mathrm{Ar}$ ), 7.08 (s, $1 \mathrm{H}, \mathrm{H}-1$ ) ; ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\} \quad \operatorname{NMR}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=193.7,166.0$, 134.7, 133.7, 133.5, 133.4, 130.0, 129.3, 129.1-128.4 (12 C), 77.9.

## 1,2-bis(2-chlorophenyl)-2-oxoethyl 2-chlorobenzoate (3ba).

Column chromatography with 18:1 cyclohexane-AcOEt afforded 3ba ( $327 \mathrm{mg}, 78 \%$ ) as a white amorphous solid. ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=8.06-7.99(\mathrm{~m}, 1 \mathrm{H}, \mathrm{Ar})$, 7.76-7.69 (m, $1 \mathrm{H}, \mathrm{Ar}), 7.75-7.58(\mathrm{~m}, 1 \mathrm{H}, \mathrm{Ar}), 7.47-7.44(\mathrm{~m}, 3 \mathrm{H}, \mathrm{Ar}+\mathrm{H}-1)$, 7.38-7.32 (m, $4 \mathrm{H}, \mathrm{Ar}), 7.32-7.27(\mathrm{~m}, 3 \mathrm{H}, \mathrm{Ar}) ;{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR (75 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=194.7,164.4,136.2,134.4,134.3,133.1$, $132.3,132.1,131.7,131.2,130.8,130.5,130.3,130.0,129.5$, 128.6, 127.3, 126.7, 126.6, 76.8; elemental analysis calcd (\%) for $\mathrm{C}_{21} \mathrm{H}_{13} \mathrm{Cl}_{3} \mathrm{O}_{3}$ : C 60.10, H 3.12 ; found: $\mathrm{C} 60.54, \mathrm{H} 3.23$.

## 1-(2-Bromophenyl)-2-oxo-2-(4-(trifluoromethyl)phenyl)ethyl

 4-(trifluoromethyl)benzoate (3ch).Column chromatography with 30:1 cyclohexane-AcOEt afforded $3 \mathrm{ch}^{14 \mathrm{~b}}$ (360 mg, 68\%) as a white foam. ${ }^{1} \mathrm{H}$ NMR (300 $\mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta=8.24-8.18(\mathrm{~m}, 2 \mathrm{H}, \mathrm{Ar}), 8.12-8.06(\mathrm{~m}, 2 \mathrm{H}, \mathrm{Ar})$, 7.74-7.68 (m, 5 H, Ar), 7.53 ( $\mathrm{s}, 1 \mathrm{H}, \mathrm{Ar}), 7.46-7.41$ (m, $1 \mathrm{H}, \mathrm{Ar})$, 7.39-7.22 (m, $2 \mathrm{H}, \mathrm{Ar}) ;{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\} \operatorname{NMR}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=$ 192.4, 164.7, 137.0, 135.7, 135.3, 135.2, 135.0, 134.9, 134.7, 134.0, 132.5, 132.3, 131.7, 130.7, 130.6, 129.2, 128.6, 127.5, 126.1, 126.0, 125.9, 125.8, 125.7, 125.6, 125.6, 125.4, 124.9, $124.8,124.8,122.3,122.1,76.8 ;{ }^{19} \mathrm{~F} \mathrm{NMR}\left(282 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=$ $-63,2\left(\mathrm{~s}, 3 \mathrm{~F}, \mathrm{CF}_{3}\right),-63.3\left(\mathrm{~s}, 3 \mathrm{~F}, \mathrm{CF}_{3}\right)$.

General procedure for the double C-aroylation of activated alkenes 4 with $\alpha$-diketones 1 mediated by KOtBu-DMF (Table 3).

To a vigorously stirred solution of $\alpha$-diketone 1 ( 1.00 mmol ) and alkene 2 ( 0.50 mmol ), in anhydrous DMF (2 mL), potassium tert-butoxide ( $112 \mathrm{mg}, 1.00 \mathrm{mmol}$ ) was added in one portion. The mixture was degassed under vacuum and saturated with argon (by an argon-filled balloon) three times. The reaction mixture was stirred at room temperature until complete disappearance or best conversion of the starting alkene (TLC analysis, ca. 2-16 h), then diluted with $\mathrm{H}_{2} \mathrm{O}(10 \mathrm{~mL})$, and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \times 50 \mathrm{~mL})$. The combined organic phases were washed with brine $(15 \mathrm{~mL})$, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, concentrated, and eluted from a column of silica gel with the suitable elution system to give 5.

## 2-Benzoyl-1,3,4-triphenylbutane-1,4-dione (5aa).

Column chromatography with 10:1 cyclohexane-AcOEt afforded 5aa ${ }^{16}$ ( $148 \mathrm{mg}, 71 \%$ ) as a white amorphous solid. ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=8.08-7.98(\mathrm{~m}, 2 \mathrm{H}, \mathrm{Ar})$, 7.95-7.89 (m, $2 \mathrm{H}, \mathrm{Ar}), 7.70-7.65(\mathrm{~m}, 2 \mathrm{H}, \mathrm{Ar}), 7.54-7.44(\mathrm{~m}, 2 \mathrm{H}, \mathrm{Ar}), 7.43-$ 7.32 ( $\mathrm{m}, 4 \mathrm{H}, \mathrm{Ar}$ ), 7.31-7.21 (m, $5 \mathrm{H}, \mathrm{Ar}), 7.14-7.06$ (m, $2 \mathrm{H}, \mathrm{Ar})$, 7.05-6.95 (m, $1 \mathrm{H}, \mathrm{Ar}), 6.38(\mathrm{~d}, J=10.7 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-2), 5.80(\mathrm{~d}, \mathrm{~J}=$ $10.7 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-3) ;{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\} \operatorname{NMR}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=198.1$, 195.9, 194.2, 136.6, 136.2, 135.9, 134.8, 133.4, 133.3, 133.1, 129.1, 129.0, 128.6, 128.5, 128.4, 127.8, 60.5, 55.2.

## 2-Benzoyl-3-(4-chlorophenyl)-1,4-diphenylbutane-1,4-dione

 (5ab).Column chromatography with 13:1 cyclohexane-AcOEt afforded $5 \mathbf{a b}^{16}$ (174 mg, 77\%) as a white amorphous solid. ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=8.04-7.96(\mathrm{~m}, 2 \mathrm{H}, \mathrm{Ar}), 7.94-7.87$ (m, $2 \mathrm{H}, \mathrm{Ar}), 7.74-7.67$ (m, $2 \mathrm{H}, \mathrm{Ar}), 7.54-7.44(\mathrm{~m}, 3 \mathrm{H}, \mathrm{Ar}), 7.44-$ 7.35 (m, 3 H, Ar), 7.35-7.27 (m, $3 \mathrm{H}, \mathrm{Ar}$ ), 7.24-7.19 (m, $2 \mathrm{H}, \mathrm{Ar}$ ),

## 2-Benzoyl-3-(4-bromophenyl)-1,4-diphenylbutane-1,4-dione

 (5ac).Column chromatography with 13:1 cyclohexane-AcOEt afforded $5 \mathrm{ac}^{16}(173 \mathrm{mg}, 70 \%)$ as a white amorphous solid. ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=8.04-7.96(\mathrm{~m}, 2 \mathrm{H}, \mathrm{Ar}), 7.95-7.88$ ( $\mathrm{m}, 2 \mathrm{H}, \mathrm{Ar}$ ), 7.73-7.67 (m, $2 \mathrm{H}, \mathrm{Ar})$, 7.53-7.43 (m, $3 \mathrm{H}, \mathrm{Ar}), 7.42-$ $7.36(\mathrm{~m}, 3 \mathrm{H}, \mathrm{Ar})$, 7.35-7.27 (m, $3 \mathrm{H}, \mathrm{Ar}), 7.26-7.20$ (m, $2 \mathrm{H}, \mathrm{Ar}$ ), 7.18-7.12 (m, $2 \mathrm{H}, \mathrm{Ar}$ ), 6.35 (d, J = $10.7 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-2$ ), 5.78 ( $\mathrm{d}, \mathrm{J}=$ $10.7 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-3) ;{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\} \operatorname{NMR}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=197.8$, 195.5, 194.0, 136.5, 136.1, 135.7, 134.0, 133.6, 133.5, 133.3, $132.2,130.7,129.0,128.7,128.7,128.6,122.0,60.4,54.4$.

## 2-Benzoyl-1-(4-chlorophenyl)-3,4-diphenylbutane-1,4-dione

 (5ad).Column chromatography with 10:1 cyclohexane-AcOEt afforded 5 ad $^{16}$ (138 $\mathrm{mg}, 61 \%$ ) as a $1: 1$ mixture of diastereoisomers. Separation of the two diastereoisomers was carried by a second column chromatography using toluene as the elution system. First eluted diastereoisomer: ${ }^{1} \mathrm{H}$ NMR (300 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=8.05-7.96(\mathrm{~m}, 2 \mathrm{H}, \mathrm{Ar}), 7.89-7.82(\mathrm{~m}, 2 \mathrm{H}, \mathrm{Ar})$, 7.66-7.58 (m, 2 H, Ar), 7.53-7.22 (m, $10 \mathrm{H}, \mathrm{Ar}$ ), 7.14-7.08 (m, 2 $\mathrm{H}, \mathrm{Ar}), 7.07-7.00(\mathrm{~m}, 1 \mathrm{H}, \mathrm{Ar}), 6.31(\mathrm{~d}, \mathrm{~J}=10.7 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-2)$, 5.78 (d, J = $10.7 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-3$ ); ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR $\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta$ = 198.0, 195.6, 193.0, 139.9, 136.5, 135.8, 134.7, 134.5, 133.5, 133.2, 130.0, 129.1, 129.0, 129.0, 128.8, 128.6, 128.5, 128.4, 128.0, 127.8, 60.4, 55.3. Second eluted diastereoisomer: ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=8.05-7.96(\mathrm{~m}, 2 \mathrm{H}, \mathrm{Ar}), 7.92-7.85$ (m, $2 \mathrm{H}, \mathrm{Ar}), 7.66-7.58(\mathrm{~m}, 2 \mathrm{H}, \mathrm{Ar}), 7.52-7.43$ (m, $2 \mathrm{H}, \mathrm{Ar}$ ), 7.417.32 (m, $4 \mathrm{H}, \mathrm{Ar}), 7.29-7.22$ (m, $4 \mathrm{H}, \mathrm{Ar})$, 7.18-7.08 (m, $2 \mathrm{H}, \mathrm{Ar}$ ), 7.07-7.00 (m, $1 \mathrm{H}, \mathrm{Ar}), 6.31(\mathrm{~d}, J=10.7 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-2), 5.77$ (d, J = $10.7 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-3) ;{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\} \operatorname{NMR}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=197.9$, 194.8, 193.8, 139.9, 136.1, 135.8, 134.9, 134.7, 133.5, 133.2, 130.0, 129.2, 129.0, 128.9, 128.8, 128.7, 128.6, 128.5, 127.9, 60.4, 55.1.

2-Benzoyl-1-(4-methoxyphenyl)-3,4-diphenylbutane-1,4dione (5ae).
Column chromatography with 6:1 cyclohexane-AcOEt afforded $5 \mathbf{a e}^{16}(94 \mathrm{mg}, 42 \%)$ as an inseparable $1: 1$ mixture of diastereoisomers. ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=8.05-7.98(\mathrm{~m}$, $2 \mathrm{H}, \mathrm{Ar}), 7.95-7.88(\mathrm{~m}, 2 \mathrm{H}, \mathrm{Ar}), 7.73-7.64(\mathrm{~m}, 2 \mathrm{H}, \mathrm{Ar}), 7.52-$ 7.41 (m, $2 \mathrm{H}, \mathrm{Ar}$ ), 7.41-7.32 (m, $4 \mathrm{H}, \mathrm{Ar}), 7.31-7.26$ (m, $2 \mathrm{H}, \mathrm{Ar})$, 7.15-7.06 (m, $2 \mathrm{H}, \mathrm{Ar}$ ), 7.06-6.98 (m, $1 \mathrm{H}, \mathrm{Ar})$, 6.85-6.69 (m, 2 H , Ar), 6.32 ( $d, J=10.8 \mathrm{~Hz}, 0.5 \mathrm{H}, \mathrm{H}-2^{\prime}$ ), $6.31(\mathrm{~d}, J=10.8 \mathrm{~Hz}, 0.5 \mathrm{H}$, $\left.\mathrm{H}-2^{\prime \prime}\right), 5.79\left(\mathrm{~d}, \mathrm{~J}=10.8 \mathrm{~Hz}, 0.5 \mathrm{H}, \mathrm{H}-3^{\prime}\right), 5.78(\mathrm{~d}, \mathrm{~J}=10.8 \mathrm{~Hz}$, $\left.0.5 \mathrm{H}, \mathrm{H}-3^{\prime \prime}\right), 3.80\left(\mathrm{~s}, 1.5 \mathrm{H}, \mathrm{CH}_{3}{ }^{\prime}\right), 3.78\left(\mathrm{~s}, 1.5 \mathrm{H}, \mathrm{CH}_{3}{ }^{\prime \prime}\right) ;{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=198.3$ ( 0.5 C ), 198.1 ( 0.5 C ), 196.0 (0.5 C), 194.4 (0.5 C), 194.0 ( 0.5 C ), 192.4 ( 0.5 C ), 163.7 ( 0.5 C ), 163.4 ( 0.5 C ), 136.7, 136.2, 136.0, 134.9, 133.3, 133.2, 133.0, 131.1, 130.3, 129.7, 129.6, 129.0, 128.7, 128.6, 128.5, 128.4, $127.7,113.8$ ( 0.5 C), 113.6 ( 0.5 C), 60.4 ( 0.5 C), 60.2 ( 0.5 C ), 55.4, 55.1 ( 0.5 C ), 55.0 ( 0.5 C ).

## 2-Benzoyl-3-(4-chlorophenyl)-1-(4-methoxyphenyl)-4-phenylbutane-1,4-dione (5af).

Column chromatography with 7:1 cyclohexane-AcOEt afforded $5 \mathbf{a f}^{16}$ (99 mg, 41\%) as an inseparable 1:1 mixture of diastereoisomers. ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=8.03-7.95(\mathrm{~m}$, $2 \mathrm{H}, \mathrm{Ar}), 7.94-7.85(\mathrm{~m}, 2 \mathrm{H}, \mathrm{Ar})$, 7.76-7.68 (m, $2 \mathrm{H}, \mathrm{Ar}$ ), 7.537.36 (m, 4 H, Ar), 7.35-7.17 (m, $4 \mathrm{H}, \mathrm{Ar}), 7.11-7.04$ (m, $2 \mathrm{H}, \mathrm{Ar}$ ), 6.84-6.73 (m, 2 H, Ar), 6.29 (d, J = $\left.10.7 \mathrm{~Hz}, 0.5 \mathrm{H}, \mathrm{H}-2^{\prime}\right), 6.28$ (d, $\left.J=10.7 \mathrm{~Hz}, 0.5 \mathrm{H}, \mathrm{H}-2^{\prime \prime}\right), 5.78\left(\mathrm{~d}, \mathrm{~J}=10.7 \mathrm{~Hz}, 0.5 \mathrm{H}, \mathrm{H}-3^{\prime}\right), 5.76$ (d, J = $10.7 \mathrm{~Hz}, 0.5 \mathrm{H}, \mathrm{H}-3^{\prime \prime}$ ), $3.81\left(\mathrm{~s}, 1.5 \mathrm{H}, \mathrm{CH}_{3}{ }^{\prime}\right), 3.78(\mathrm{~s}, 1.5 \mathrm{H}$, $\left.\mathrm{CH}_{3}{ }^{\prime \prime}\right) ;{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR $\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=198.0$ (0.5 C), 197.9 ( 0.5 C), 195.7 ( 0.5 C), 194.3 ( 0.5 C), 193.6 ( 0.5 C), 192.2 ( 0.5 C), 163.8 ( 0.5 C), 136.6, 136.2, 135.8, 133.8, 133.5, 133.4, 133.3, 131.1, 130.4, 130.3, 129.4, 129.2, 129.0, 128.6, 113.9 (0.5 C), 113.8 ( 0.5 C ), 60.3 ( 0.5 C ), 60.1 ( 0.5 C ), 55.5 ( 0.5 C ), 55.4 ( 0.5 C), 54.3 ( 0.5 C ), 54.1 ( 0.5 C ).

## 2-Benzoyl-3-phenyl-1,4-bis(4-(trifluoromethyl)phenyl)butane-1,4-dione (5ca).

Column chromatography with 16:1 cyclohexane-AcOEt afforded 5 ca $^{16}$ ( $85 \mathrm{mg}, \mathbf{3 0 \%}$ ) as a $19: 1$ mixture of diastereoisomers. For the major isomer: ${ }^{1} \mathrm{H}$ NMR $(300 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right): \delta=8.12-8.06(\mathrm{~m}, 2 \mathrm{H}, \mathrm{Ar}), 8.02-7.96(\mathrm{~m}, 2 \mathrm{H}, \mathrm{Ar}), 7.78-$ $7.70(\mathrm{~m}, 2 \mathrm{H}, \mathrm{Ar}), 7.69-7.58$ (m, $4 \mathrm{H}, \mathrm{Ar}), 7.52-7.43$ (m, $2 \mathrm{H}, \mathrm{Ar}$ ), 7.32-7.27 (m, $2 \mathrm{H}, \mathrm{Ar}$ ), 7.25-7.21 (m, $2 \mathrm{H}, \mathrm{Ar}$ ), 7.16-7.10 (m, 2 H , Ar), 6.35 (d, J = $10.7 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-2$ ), 5.75 (d, $J=10.7 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-$ 3); ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=197.2,195.2,193.4$, 138.7, 138.5, 136.2, 133.8, 130.5, 129.4, 129.3, 128.9, 128.6, 128.6, 128.3, 128.3, 126.5, 125.8, 125.7, 123.1 (q, $J=270 \mathrm{~Hz}, 2$ $\mathrm{CF}_{3}$ ), 60.5, 55.6; ${ }^{19} \mathrm{~F}$ NMR ( $282 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=-63.0,-63.2,-$ 63.3, -63.4.

## 2-Hydroxy-N,N-dimethyl-2-phenylacetamide (6).

Benzaldehyde ( $0.31 \mathrm{~mL}, 3.00 \mathrm{mmol}$ ) and DMF ( $0.23 \mathrm{~mL}, 3.00$ mmol) were dissolved in anhydrous THF ( 7.5 mL ) and stirred vigorously. To this cooled $\left(-70{ }^{\circ} \mathrm{C}\right)$ solution, it was added a lithium diisopropylamine solution ( $0.56 \mathrm{M}, 5.34 \mathrm{~mL}, 3.00$ mmol), which in turn was freshly prepared from diisopropylamine ( $0.96 \mathrm{~mL}, 6.85 \mathrm{mmol}$ ) and $n$-butyllithium ( 2.0 M solution in $n$-hexane, $3.30 \mathrm{~mL}, 6.60 \mathrm{mmol}$ ) in anhydrous THF $(7.5 \mathrm{~mL})$ and precooled to $-70{ }^{\circ} \mathrm{C}$. The reaction mixture was stirred for 5 h at $-70{ }^{\circ} \mathrm{C}$, then allowed to reach room temperature and quenched with saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ solution ( 2.5 mL ). The organic phase was separated, dried ( $\mathrm{Na}_{2} \mathrm{SO}_{4}$ ), concentrated, and eluted from a column of silica gel with 3.5:1 cyclohexane-AcOEt to separate apolar compounds, and then with $10: 1$ AcOEt-MeOH to afford $6^{36}$ ( $242 \mathrm{mg}, 45 \%$ ) as a white amorphous solid. ${ }^{1} \mathrm{H} \mathrm{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=$ 7.40-7.28 (m, 5 H, Ar), 5.18 (d, J = $4.9 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-2$ ), 4.75 (d, J = $4.9 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{OH}), 3.02\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 2.76\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right) ;{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=172.4,139.2,129.1,128.6,127.6$, 71.6, 36.5, 36.4; elemental analysis calcd (\%) for $\mathrm{C}_{10} \mathrm{H}_{13} \mathrm{NO}_{2}: \mathrm{C}$ 67.02, H 7.31, N 7.82; found: C 67.61, H 7.02, N 7.48.

2-(Dimethylamino)-2-oxo-1-phenylethyl benzoate (7).

To a vigorous stirred solution of $6(0.14 \mathrm{~g}, 0.80 \mathrm{mmol})$, pyridine $(1.25 \mathrm{~mL})$ and benzoyl chloride ( $1.20 \mathrm{mmol}, 0.14 \mathrm{~mL}$ ) DMAP $(4.9 \mathrm{mg}, 0.04 \mathrm{mmol})$ was added in one portion. The reaction mixture was stirred at room temperature under Ar atmosphere for 16 h . The mixture was then concentrated and eluted from a column of silica gel with 2.5:1 cyclohexaneAcOEt to afford 7 (158 mg, 70\%) as a white amorphous solid. ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=8.11-8.07(\mathrm{~m}, 2 \mathrm{H}, \mathrm{Ar}), 7.60-7.50$ (m, $3 \mathrm{H}, \mathrm{Ar}$ ), 7.45-7.38 (m, $5 \mathrm{H}, \mathrm{Ar}$ ), 6.45 ( $\mathrm{s}, 1 \mathrm{H}, \mathrm{H}-1$ ), 3.03 (s, 3 $\left.\mathrm{H}, \mathrm{CH}_{3}\right), 2.99\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right) ;{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\} \mathrm{NMR}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=$ 168.0, 166.3, 134.2, 133.3, 130.1, 129.6, 129.4, 129.1, 128.6, 128.4, 73.8, 36.9, 36.2; elemental analysis calcd (\%) for $\mathrm{C}_{17} \mathrm{H}_{17} \mathrm{NO}_{3}$ : C 72.07, H 6.05, N 4.49; found: C $72.64, \mathrm{H} 5.86, \mathrm{~N}$ 4.07.

## 3-(2-chlorophenyl)-2,3-dihydroxy-N,N-dimethyl-2phenylpropanamide (8).

To a vigorously stirred solution of $7(45 \mathrm{mg}, 0.16 \mathrm{mmol})$ and ochlorobenzaldehyde 2a ( $182 \mu \mathrm{~L}, 0.16 \mathrm{mmol}$ ) in anhydrous DMF $(1 \mathrm{~mL})$, potassium tert-butoxide ( $18 \mathrm{mg}, 0.16 \mathrm{mmol}$ ) was added in one portion. The mixture was degassed under vacuum and saturated with argon (by an argon-filled balloon) three times. The reaction was stirred at room temperature for 16 h , then diluted with saturated $\mathrm{NH}_{4} \mathrm{Cl}(2 \mathrm{~mL})$ and extracted with $\mathrm{Et}_{2} \mathrm{O}$ $(10 \mathrm{~mL} \times 2)$. The combined organic phases were dried ( $\mathrm{Na}_{2} \mathrm{SO}_{4}$ ), concentrated, and eluted from a column of silica gel with 5:1 cyclohexane-AcOEt to separate apolar compounds, and then with 10:1 AcOEt-MeOH to afford 8 (11 mg, 22\%) as a white amorphous solid. ${ }^{1} \mathrm{H} \mathrm{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=7.67-$ 7.62 ( $\mathrm{m}, 1 \mathrm{H}, \mathrm{Ar}$ ), 7.24-7.06 (m, $5 \mathrm{H}, \mathrm{Ar})$, 7.04-6.96 (m, $3 \mathrm{H}, \mathrm{Ar}$ ), $6.10(\mathrm{~d}, \mathrm{~J}=3.7 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-3), 4.19(\mathrm{~d}, \mathrm{~J}=3.7 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{OH}-3), 3.94$ (s, $1 \mathrm{H}, \mathrm{OH}-2$ ), $3.01\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 2.70\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right) ;{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=173.8,137.0,134.9,134.3,129.9$, $128.8,128.6,127.9,127.8,126.1,125.5,82.5,73.6,38.2,37.1$; elemental analysis calcd (\%) for $\mathrm{C}_{17} \mathrm{H}_{18} \mathrm{ClNO}_{3}: \mathrm{C} 63.85, \mathrm{H} \mathrm{5.67,N}$ 4.38; found: C 63.34, H 5.89, N 4.89.

## Coupling of nitrile 9 with o-chlorobenzaldehyde 2a (Scheme

 2).To a vigorously stirred solution of $9^{18}(38 \mathrm{mg}, 0.16 \mathrm{mmol})$ and o-chlorobenzaldehyde 2a ( $182 \mu \mathrm{~L}, 0.16 \mathrm{mmol}$ ) in anhydrous DMF ( 1 mL ), potassium tert-butoxide ( $18 \mathrm{mg}, 0.16 \mathrm{mmol}$ ) was added in one portion. The mixture was degassed under vacuum and saturated with argon (by an argon-filled balloon) three times. The reaction was stirred at room temperature for 16 h , then diluted with saturated $\mathrm{NH}_{4} \mathrm{Cl}(2 \mathrm{~mL})$ and extracted with $\mathrm{Et}_{2} \mathrm{O}(10 \mathrm{~mL} \times 2)$. The combined organic phases were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, concentrated, and eluted from a column of silica gel with $20: 1$ cyclohexane-AcOEt to give 3aa ( 36 mg , $65 \%)$ as a white foam.

## 2-Hydroxy- $\mathrm{N}, \mathrm{N}$-dimethyl-2,2-diphenylacetamide (12).

Benzophenone 11 ( $0.55 \mathrm{~g}, 3.00 \mathrm{mmol}$ ) and DMF ( $0.23 \mathrm{~mL}, 3.00$ mmol ) were dissolved in anhydrous THF ( 7.5 mL ) and stirred vigorously. To this cooled (-70 ${ }^{\circ} \mathrm{C}$ ) solution, it was added a lithium diisopropylamine solution ( $0.56 \mathrm{M}, 5.34 \mathrm{~mL}, 3.00$ mmol), which in turn was freshly prepared from
diisopropylamine ( $0.96 \mathrm{~mL}, 6.85 \mathrm{mmol}$ ) and $n$-butyllithium ( 2.0 M solution in $n$-hexane, $3.30 \mathrm{~mL}, 6.60 \mathrm{mmol}$ ) in anhydrous THF $(7.5 \mathrm{~mL})$ and precooled to $-70{ }^{\circ} \mathrm{C}$. The reaction mixture was stirred for 5 h at $-70{ }^{\circ} \mathrm{C}$, then allowed to reach room temperature and quenched with saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ solution ( 2.5 mL ). The organic phase was separated, dried ( $\mathrm{Na}_{2} \mathrm{SO}_{4}$ ), concentrated, and eluted from a column of silica gel with 5:1 cyclohexane-AcOEt to afford 12 ( $574 \mathrm{mg}, 70 \%$ ) as a white amorphous solid. ${ }^{1} \mathrm{H} \operatorname{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=7.38$ 7.30 ( m, $10 \mathrm{H}, \mathrm{Ar}$ ), 6.00 ( $\mathrm{s}, 1 \mathrm{H}, \mathrm{OH}$ ), 3.11 (bs, $3 \mathrm{H}, \mathrm{CH}_{3}$ ), 2.55 (bs, $3 \mathrm{H}, \mathrm{CH}_{3}$ ); ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR $\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=173.6,141.7$, 128.4, 128.3, 128.0, 80.8, 39.5, 38.0; elemental analysis calcd (\%) for $\mathrm{C}_{16} \mathrm{H}_{17} \mathrm{NO}_{2}$ : C 75.27, H 6.71, N 5.49 ; found: C 75.68, H 6.38, N 5.83.

Coupling of benzyl 1a with o-chlorobenzaldehyde 2a mediated by D (Scheme 3).
Compound 12 ( $76 \mathrm{mg}, 0.30 \mathrm{mmol}$ ) was dissolved in anhydrous NMP ( 0.5 mL ). The reaction mixture was cooled to $0^{\circ} \mathrm{C}$ and then NaH ( $60 \%$ mineral dispersion, $14 \mathrm{mg}, 0.36 \mathrm{mmol}$ ) was added in one portion. The resulting mixture was degassed under vacuum and saturated with argon (by an argon-filled balloon) three times. The mixture was allowed to reach room temperature and after 30 minutes was added dropwise by cannula to a degassed (Ar atmosphere) solution of benzil 1a ( $62 \mathrm{mg}, 0.30 \mathrm{mmol}$ ) and o-chlorobenzaldehyde 2a ( $33 \mu \mathrm{~L}, 0.30$ mmol ) in NMP ( 0.5 mL ). The mixture was stirred at room temperature for 16 h then diluted with saturated $\mathrm{NH}_{4} \mathrm{Cl}(1 \mathrm{~mL})$ and extracted with $\mathrm{Et}_{2} \mathrm{O}(5 \mathrm{~mL} \times 2)$. The combined organic phases were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, concentrated, and eluted from a column of silica gel with 20:1 cyclohexane-AcOEt; TLC and NMR analysis did not reveal the formation of the target product 3aa.

Coupling of benzil 1a with o-chlorobenzaldehyde $2 a$ in the presence of the radical scavenger TEMPO.
To a vigorously stirred solution of benzil 1a (105 mg, 0.50 mmol ), o-chlorobenzaldehyde 2a ( $56 \mu \mathrm{~L}, 0.50 \mathrm{mmol}$ ) and 2,2,6,6-tetramethylpiperidine 1-oxyl (TEMPO) ( $235 \mathrm{mg}, 1.50$ mmol) in anhydrous DMF ( 1 mL ), potassium tert-butoxide (14 $\mathrm{mg}, 0.125 \mathrm{mmol}$ ) was added in one portion. The mixture was degassed under vacuum and saturated with argon (by an argon-filled balloon) three times. The reaction mixture was stirred at room temperature for 30 min , then diluted with $\mathrm{H}_{2} \mathrm{O}$ $(5 \mathrm{~mL})$ and extracted with $\mathrm{Et}_{2} \mathrm{O}(2 \times 25 \mathrm{~mL})$; the combined organic phases were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, concentrated, and eluted from a column of silica gel with 20:1 cyclohexane-AcOEt to give 3aa (152 mg, 87\%).

Coupling of benzil 1a with o-chlorobenzaldehyde $2 a$ in the presence of the radical scavenger PBN.
To a vigorously stirred solution of benzil 1a (105 mg, 0.50 mmol), o-chlorobenzaldehyde 2a ( $56 \mu \mathrm{~L}, 0.50 \mathrm{mmol}$ ) and $N$ -tert-butyl- $\alpha$-phenyl nitrone (PBN) ( $266 \mathrm{mg}, 1.50 \mathrm{mmol}$ ) in anhydrous DMF ( 1 mL ), potassium tert-butoxide ( $14 \mathrm{mg}, 0.125$ mmol ) was added in one portion. The mixture was degassed under vacuum and saturated with argon (by an argon-filled
balloon) three times. The reaction mixture was stirred at room temperature for 30 min , then diluted with $\mathrm{H}_{2} \mathrm{O}(5 \mathrm{~mL})$ and extracted with $\mathrm{Et}_{2} \mathrm{O}(2 \times 25 \mathrm{~mL})$; the combined organic phases were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, concentrated, and eluted from a column of silica gel with 20:1 cyclohexane-AcOEt to give 3aa ( 142 mg , 81\%).

## (Z)-1,2-Diphenylethene-1,2-diyl diacetate (13).

To a vigorously stirred solution of benzil 1a ( $210 \mathrm{mg}, 1.00$ mmol ) in anhydrous DMF ( 2 mL ), potassium tert-butoxide ( 28 $\mathrm{mg}, 0.25 \mathrm{mmol}$ ) was added in one portion. The mixture was degassed under vacuum and saturated with argon (by an argon-filled balloon) three times. After 10 minutes acetic anhydride ( $0.47 \mathrm{~mL}, 5.00 \mathrm{mmol}$ ) was added in one portion (rapid change of color was observed). The reaction mixture was stirred at room temperature for 1 h , then diluted with $\mathrm{H}_{2} \mathrm{O}$ $(5 \mathrm{~mL})$ and extracted with $\mathrm{Et}_{2} \mathrm{O}(2 \times 25 \mathrm{~mL})$; the combined organic phases were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, concentrated, and eluted from a column of silica gel with 7:1 cyclohexane-AcOEt to give 13 as a white amorphous solid ( $23 \mathrm{mg}, 8 \%$ ). ${ }^{1} \mathrm{H} \mathrm{NMR}(300 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right): \delta=7.30-7.16(\mathrm{~m}, 10 \mathrm{H}, \mathrm{Ar}), 2.21\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{CH}_{3}\right) ;{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=168.1,138.5,133.0,128.8,128.8$, 128.2, 20.7; elemental analysis calcd (\%) for $\mathrm{C}_{18} \mathrm{H}_{16} \mathrm{O}_{4}$ : C 72.96, H 5.44; found: C 72.56, H 5.88.

## Crossover experiment (Scheme 7).

To a vigorously stirred solution of benzil 1a (105 mg, 0.50 mmol), o-chlorobenzaldehyde 2a (56 $\mu \mathrm{L}, 0.50 \mathrm{mmol}$ ), substituted benzoin 14 ( $140 \mathrm{mg}, 0.50 \mathrm{mmol}$ ) in anhydrous DMF ( 1 mL ), potassium tert-butoxide ( $14 \mathrm{mg}, 0.125 \mathrm{mmol}$ ) was added in one portion. The mixture was degassed under vacuum and saturated with argon (by an argon-filled balloon) three times. The reaction mixture was stirred at room temperature for 30 min , then diluted with $\mathrm{H}_{2} \mathrm{O}(5 \mathrm{~mL})$ and extracted with $\mathrm{Et}_{2} \mathrm{O}(2 \times 25 \mathrm{~mL})$; the combined organic phases were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, concentrated, and eluted from a column of silica gel with 20:1 cyclohexane-AcOEt to give 3aa ( 143 mg , $82 \%)$ as the only isolable product.

## Acknowledgements

We gratefully acknowledge the University of Ferrara (fondi FAR) and the "Progetto Bandiera" N-CHEM for financial support. Thanks are also given to Mr Paolo Formaglio for NMR experiments and to Mrs Ercolina Bianchini for elemental analyses. We also thank Prof. M. Fogagnolo, Prof. G. Fantin and Dr. P. Dambruoso for fruitful discussions.

22 During the preparation of this manuscript, Tuttle, Murphy, and their co-workers revisited the initiation mechanism of $\mathrm{S}_{\mathrm{RN}} 1$ reactions promoted by the KOtBu-DMF system (Refs. 45) and proposed dimeric forms of DMF generated from $\mathbf{C}$ as alternative electron donors (reaction conditions: excess KOtBu, $\left.130^{\circ} \mathrm{C}, 18 \mathrm{~h}\right)$ : J. P. Barham, G. Coulthard, K. J. Emery, E. Doni, F. Cumine, G. Nocera, M. P. John, L. E. A. Berlouis, T. McGuire, T. Tuttle and J. A. Murphy, J. Am. Chem. Soc., 2016, 138, 7402-7410. Although the structure of these novel electron donor species have not been calculated herein, the overall conclusions of the present mechanistic study will not be affected.

24 The carbamoyl anion C generated in KOtBu-DMF can react with PBN affording the corresponding hydroxylamine; this species is EPR silent but, under basic and aerobic conditions, it can be converted into the corresponding paramagnetic nitroxide. The involvement of this species, however, seems to be excluded in the experiment of Figure 5 (black line) since a similar weak, undefined signal was also obtained in a parallel EPR experiment performed under deaerated conditions (see Figure S5).

## Mass spectrometric experiments

The mass spectrometric investigations were carried out on a LCQ Duo (ThermoQuest, San Jose, CA, USA), equipped with an electrospray ionization source operating in negative-ion mode. Instrumental parameters: capillary voltage -10 V , spray voltage 4.50 kV , capillary temperature of $150{ }^{\circ} \mathrm{C}$, mass scan range from $\mathrm{m} / \mathrm{z} 50$ to $1200 ; \mathrm{N}_{2}$ was used as sheath gas. The samples were injected into the spectrometer by a syringe pump at a constant flow rate of $8 \mu \mathrm{~L} / \mathrm{min}$ using the appropriate eluting solvent.

Figure S1. Full scan spectrum of the benzoin-like reaction of $\mathbf{1 a}(0.5 \mathrm{M}), \mathbf{2 a}(0.5 \mathrm{M})$ in DMF with $\mathrm{KO} t \mathrm{Bu}(0.125 \mathrm{M})$ showing the presence of anion $\mathbf{E}(\mathrm{m} / \mathrm{z} 90)$ and isobaric species $\mathbf{I}-\mathrm{III}(\mathbf{E})(\mathrm{m} / \mathrm{z} 300)$.

Figure S2. MS/MS mass spectrum of the deuterated adduct $\mathbf{I I I}(\mathbf{E})$ - $\boldsymbol{d}$ obtained from DMF- $\boldsymbol{d}_{7}$ solutions of $\mathbf{1 a}(0.5 \mathrm{M}), \mathbf{2 a}(0.5 \mathrm{M})$ and $\mathrm{KO} t \mathrm{Bu}(0.125 \mathrm{M})$.

## EPR experiments

EPR investigation was carried out with a Bruker ER200 MRD spectrometer calibrated with $\alpha, \alpha$ diphenylpicrylhydrazyl (dpph, resonance at $3457.41 \mathrm{G}, \mathrm{g}=2.0023$ ) and equipped with a TE201 resonator (microwave frequency of 9.4 GHz ). A flat quartz cell was used for all the experiments. Samples were DMF solutions containing $\mathrm{KOtBu}(0.125 \mathrm{M})$ to which benzyl $\mathbf{1 a}(0.5 \mathrm{M})$ and aldehyde $\mathbf{2 a}(0.5 \mathrm{M})$ were added stepwise and when necessary. In the case of EPR spin trapping experiments, DMF solutions contain from the beginning $\alpha$-phenyl-N-tert-butyl nitrone (PBN, 0.5 $\mathrm{M})$ as radical trap. When requested benzyl $\mathbf{1 a}(0.5 \mathrm{M})$ and aldehyde $\mathbf{2 a}(0.5 \mathrm{M})$ were progressively added.

Figure S3. Fixed-field EPR signal intensity of a radical species ( $\mathrm{g}=2.0017$ ) in time obtained by the addition of aldehyde $\mathbf{2 a}(0.5 \mathrm{M})$ to a DMF solution of $\mathrm{KOtBu}(0.125 \mathrm{M})$ and of benzil $\mathbf{1 a}(0.5 \mathrm{M})$.

Figure S4. Fixed-field EPR signal intensity of the paramagnetic adduct [PBN-benzyl anion radical $\mathbf{V}]^{\bullet}$ in time. ( $\bullet$ ) DMF solution containing $\mathrm{KO} t \mathrm{Bu}(0.125 \mathrm{M})$, benzil $\mathbf{1 a}(0.5 \mathrm{M})$ and $\operatorname{PBN}(0.5 \mathrm{M})$.
$(\mathbf{\Delta})$ the same as before with the addition of aldehyde $\mathbf{2 a}(0.5 \mathrm{M})$.

Figure S5. Anaerobic EPR spectrum of a DMF solution containing $\mathrm{KOt} t \mathrm{Bu}(0.125 \mathrm{M})$ and $\mathrm{PBN}(0.5$ M).

## Computational methods, Cartesian coordinates and energies in Hartree for species calculated

DFT calculations were carried out with the Truhlar M06 hybrid functional, ${ }^{1}$ together with the 6-31+ $\mathrm{G}(\mathrm{d}, \mathrm{p})$ basis set within the framework of the Gaussian 09 suite of programs. ${ }^{2}$ All the molecular structures were fully optimized by using the PCM continuum model (N,N-dimethylformamide and dimethylsulfoxide) ${ }^{3}$ and the Berny analytical gradient optimization method, whereby the stationary points were characterized by frequency calculation. Thermochemical analysis (free energies $\Delta \Delta \mathrm{G}$ ) was performed at 298.15 K , starting from the frequency calculations.

Electronic energies (E, u.a.), Gibbs free energies ( $\Delta \mathrm{G}$, u.a.), and fully optimized structures [M06//6$31+G(d, p)$ level using PCM continuum model (N,N-dimethylformamide and dimethylsulfoxide)] are reported in the next pages (pp. S5-S14).
