#### Abstract

The 2-amino-3-( $p$-chlorobenzoyl)thiophene scaffold has been widely employed as a pharmacophore for the identification of small molecules acting as allosteric modulators at the adenosine $A_{1}$ receptor. A new series of 2-amino-3-(p-chlorobenzoyl)-4-benzyl-5-arylthiophene derivatives, characterized by the absence as well as the presence of electron-releasing or electronwithdrawing groups on the phenyl ring at the 4 - and 5-positions of the thiophene ring, were identified as positive allosteric enhancers at the adenosine $\mathrm{A}_{1}$ receptor in binding (saturation, competition and dissociation kinetics) and functional assays. To better understand the positional requirements of substituents on the 2-amino-3-(p-chlorobenzoyl)thiophene core, the corresponding regioisomeric 4-aryl-5-benzylthiophene analogues were synthesized and found to possess reduced allosteric enhancer activity.

Keywords: $\mathrm{A}_{1}$ adenosine receptor; allosteric modulator, G protein-coupled receptors; antinociceptive effect.

## 1. Introduction

Adenosine, an important tissue-protective endogenous hormone released from almost all cells, mediates its effect through binding interactions with four G protein-coupled receptors (GPCRs), named $A_{1}, A_{2 A}, A_{2 B}$, and $A_{3}[1]$. Activation of the $A_{1}$ adenosine receptor $\left(A_{1} A R\right)$ causes inhibition of the activity of the enzyme adenylate cyclase coupled by an inhibitory G-protein (Gi), reducing intracellular levels of cyclic adenosine monophosphate (cAMP) [2]. A ARs are highly and extensively expressed in brain, cortex, cerebellum and ippocampus and also present in other tissues such as kidney, fat cells, bladder, and heart [3]. As a consequence, the potential therapeutic applications of the $\mathrm{A}_{1} \mathrm{AR}$ modulation have been investigated for the treatment of several diseases such as cardiovascular and central nervous system disorders and cancer [4]. In particular, selective $\mathrm{A}_{1} \mathrm{AR}$ antagonists could be used as potential target for the treatment of Alzheimer's and Parkinson's diseases [5]. It is well known that the antiamnesic activities is exhibited by adenosine $\mathrm{A}_{1} \mathrm{AR}$ antagonists which are effective in altering memory, promoting a facilitation and a recognition
memory impairment [6]. Moreover, AıAR agonists are able to mediate sedative, anticonvulsant, anxiolytic, analgesic and locomotor depressant effects induced by adenosine [3, 7]. Thus, AıAR agonist administration decreased nociceptive responses in different animal models of pain, suggesting their involvement in pain modulation. Although potent and selective $A_{1} A R$ agonists have been developed, none are available for clinical use due to their cardiac and renal side-effects and poor accessibility to the central nervous system [7]. To address the problem of side effects, the approach of allosteric modulators for $\mathrm{A}_{1} \mathrm{ARs}$ as potential therapeutic agents has been developed [8]. A positive allosteric enhancer (AE) is a molecule that binds to a receptor at a site topographically distinct from the orthosteric site that binds the natural ligand, amplifying the activity or increasing the affinity of an endogenous ligand or a synthetic agonist at its receptor [9]. The probable location of the allosteric site on the $\mathrm{A}_{1} \mathrm{AR}$, as well as the amino acids involved in the interaction of the allosteric binding site, are unknown [10]. Narlawar et al. speculated that the allosteric site of the $\mathrm{A}_{1} \mathrm{AR}$ is located in close proximity to the orthosteric site [11].

AEs of the $\mathrm{A}_{1}$ AR amplify the action of adenosine locally released in high concentrations during ischemic, hypoxic or inflammatory events, presumably avoiding the side effects associated with the indiscriminate activation of the $\mathrm{A}_{1} \mathrm{AR}$ throughout the body [12]. Hence, an AE might be useful therapeutically in hypoxic or ischemic tissues where it was essential to enhance locally the action of released adenosine [13]. AEs at the $\mathrm{A}_{1} \mathrm{AR}$ may have great potential as analgesics and neuroprotective agents considering that anti-nociception represents one of the most important roles of $\mathrm{A}_{1} \mathrm{AR}$ stimulation [14].

The 2-amino-3-aroylthiophene scaffold has been widely employed as a pharmacophore for the identification of molecules acting as allosteric modulators at the adenosine $\mathrm{A}_{1}$ receptor [15]. It has already been observed that the presence of the 2 -amino group and 3 -benzoyl moiety seem to be essential parts of the molecule for allosteric enhancer activity at the $\mathrm{A}_{1} \mathrm{AR}$. In addition, the presence of a lipophilic substitution on the phenyl of the 3-benzoyl moiety, such as a 3-trifluoromethyl present in PD 81,723 (1a) [16a, 16b], the 3,4-dichloro in LUF5484 (1b) [16c], the 4-chloro in T62
(1c) $[16 \mathrm{a}, 16 \mathrm{~b}]$, the 3 -chloro in PD 71,605 (1d) $[16 \mathrm{a}, 16 \mathrm{~b}]$ and the 4 -methyl in $\mathbf{1 e}$ [16c] favours allosteric enhancer activity at the $\mathrm{A}_{1} \mathrm{AR}$ (Chart 1). Several research groups have highlighted the crucial importance of 4- and 5-thiophene substitution, modification of which allows the AE activity to be greatly modulated [17]. The 4-position is known to tolerate the presence of a wide variety of substituents, which include alkyl chains, phenyl rings with electron-releasing or electronwithdrawing groups (ERG's or EWG's, respectively) [17c] as well as a methylene unit linked to arylpiperazine [19] or tert-butyl [19] moieties (compounds with general structure $\mathbf{2}$ and $\mathbf{3}$, respectively). Aryl/heteroaryl rings linked directly [18c, 19] or by an acetylene spacer [20] at the C5 position of the thiophene nucleus, concomitant with substitution at the C-4 position, were tolerated and contributed additively to the AE activity, decreasing in the order aryl $>\mathrm{H}>$ arylethynyl and arylethynyl>aryl>H for compounds with general structures $\mathbf{2}$ and 3, respectively. It has been previously shown that aryl rings at the 5-position, along with hydrogen or methyl substitution at the 4-position favoured antagonistic properties [21, 17f]. Many authors have postulated the existence of two different regions in the allosteric binding site of the $\mathrm{A}_{1} \mathrm{AR}$ [16b, 22]. One region is able to accommodate the 2-amino and 3-benzoyl groups, which were found to be crucial for the AE activity. A second wide, hydrophobic domain is able to interact with alkyl and aryl substituents at the $\mathrm{C}-4$ and $\mathrm{C}-5$ positions of thiophene ring.

Thus, once the 2-amino-3-(p-chlorobenzoyl) thiophene scaffold was identified as the minimum structural requirement for the AE activity, and the presence of hydrophobic substituents, such as aryl moieties at $\mathrm{C}-5$, was deemed critical for optimal interaction with the allosteric site of the $\mathrm{A}_{1} \mathrm{AR}$, our strategy for further improvement of the activity was to perform modification at the 4position of the thiophene ring. From the previously described series of 2-amino-3-(p-chlorobenzoyl)-4-neopentyl-5-arylthiophene structure (3) [19], the first round of optimization included replacement of the neopentyl moiety with a benzyl group, to furnish a new series of 2-amino-3-(p-chlorobenzoyl)-4-(substituted)benzyl-5-arylthiophene analogues, exemplified by structure $\mathbf{4 a}$ (Chart 2).

Replacing the phenyl group of the 4-benzyl moiety with the more lipophilic and sterically more bulky naphth-1-yl group led to compound $\mathbf{4 b}$. For compounds $\mathbf{4 c} \mathbf{c} \mathbf{m}$, we fixed the aryl group at the C-5 position of the thiophene ring as an unsubstituted phenyl, and focused modifications on the phenyl of the benzyl moiety at the $\mathrm{C}-4$ position by adding electron-withdrawing ( $\mathrm{F}, \mathrm{Cl}, \mathrm{CF}_{3}$ and $\left.\mathrm{OCF}_{3}\right)$ and electron-releasing $\left(\mathrm{CH}_{3}\right.$, alkoxy and $\left.\mathrm{SCH}_{3}\right)$ groups. To analyze the effects of additional methyl and methoxy groups on the 4-benzyl moiety, we synthesized analogues $\mathbf{4 n} \mathbf{- 0}$ and $\mathbf{4 p - q}$, respectively. In addition to an unsubstituted phenyl moiety at $\mathrm{C}-5$ of the thiophene nucleus (compounds $\mathbf{4 a - q}$ ), we have also introduced substituents on the $\mathrm{C}-5$ phenyl with opposite electronic effects, including halogens (fluorine and chlorine for compounds $\mathbf{4 r} \mathbf{- w}$ and $\mathbf{4 x} \mathbf{- a b}$, respectively) and methoxy (derivatives 4ac-af).

We continued to explore the potential of molecules of this type by the synthesis of a second series of analogues with general structure $\mathbf{5}$, containing a phenyl moiety at the 4 -positions of the 2 -amino-3-(p-chlorobenzoyl)thiophene core and various substituted benzyl groups at the 5-position (Chart 2). These latter molecules can be viewed as positional isomers of the compounds with general formulae 4, which are characterized by the presence of a benzyl moiety at the 4-position and a phenyl group at the 5-position of the thiophene nucleus, respectively.

## 2. Chemistry

The 2-amino-3-(p-chlorobenzoyl)-4-benzyl-5-arylthiophene derivatives 4a-af were prepared following the procedure reported in the Scheme 1. The 4-bromomethyl thiophenes 6a-d [23] were subjected to palladium-catalyzed cross-coupling conditions in the presence of the appropriate
 analogues 7a-af, which were transformed to the final compounds $\mathbf{4 a}$-af by treatment with hydrazine in ethanol at reflux.

The isomeric 2-amino-3-(p-chlorobenzoyl)-4-phenyl-5-benzylthiophene derivatives 5a-f were synthesized by the approach shown in Scheme 2. Phthaloyl protection of the 2 -amino group of $\mathbf{8}$ [19] with phthalic anhydride in acetic acetic at reflux furnished almost quantitatively the
phthalimido derivative 9. Subsequent bromination with NBS and a catalytic amount of benzoyl peroxide in refluxing $\mathrm{CCl}_{4}$ afforded the 5-bromomethyl analogue 10, used as a common building block for the synthesis of the final compounds 5a-f by the same two-step procedure employed for the synthesis of compounds $\mathbf{4 a}$-af. The intermediate $\mathbf{1 0}$ was coupled with the appropriate arylboronic acid by a standard Suzuki cross-coupling reaction to furnish the 5-benzylthiophene derivatives 11a-i, followed by the removal of the phthaloyl protecting group with hydrazine in refluxing ethanol to afford final compounds 5a-i.

## 3. Biological Results and Discussion

### 3.1. Functional assays.

The allosteric enhancement by the 4-benzyl-5-arylthiophenes 4a-af and the corresponding regioisomeric analogues 5a-i was initially measured using a functional assay, evaluating their ability to inhibit forskolin-stimulated cAMP accumulation in CHO cells expressing the cloned $\mathrm{hA}_{1} \mathrm{AR}$. Activation of this receptor causes a measurable inhibition of adenylate cyclase activity and a reduction of cAMP content in the CHO cells. AEs are thought to act by stabilizing the active conformation of the $\mathrm{A}_{1} \mathrm{AR}$, leading to a reduction in the cAMP content of the cells [24].

The reference compounds 1a (PD 81,723), 2a, and 3a, along with the new synthesized derivatives $\mathbf{4 a - a}$ and $\mathbf{5 a - i}$ were tested at a concentration of $10 \mu \mathrm{M}$ alone and at a 100 -fold lower concentration $(100 \mathrm{nM})$ in the presence of the orthosteric agonist CCPA $(1 \mathrm{pM})$ to assess enhancement of the $\mathrm{A}_{1} \mathrm{AR}$ agonist activity. Figures 1 A and 1 B show histograms of the reduction in cAMP levels mediated by PD 81,723 , as well as representative compounds $\mathbf{4 g}, \mathbf{4} \mathbf{j}$, and $\mathbf{4 z}$, at the two aforementioned concentrations ( $10 \mu \mathrm{M}$ alone and 100 nM in the presence of CCPA, respectively). A reduction in cAMP content is indicated in Table 1 as a percentage inhibition of cAMP production relative to control (absence of the test compound), in the absence or presence of the orthosteric agonist. CCPA alone caused a slight reduction of cAMP content in CHO cells by activation of $\mathrm{A}_{1}$ ARs (data not shown). The degree of inhibition of cAMP production by each of the
novel AEs was similar under the two conditions tested. The novel allosteric enhancers are thought to shift the $\mathrm{A}_{1}$ adenosine receptor from the inactive to the active conformational state, presumably increasing the constitutive activity of the receptors and inhibiting the forskolin-induced cAMP production, even in the absence of the orthosteric agonist.

In the series of 5-phenylthiophene derivatives $\mathbf{4 a - q}$, the data shown in Table 1 indicate that the activity of the AEs can be influenced by steric, electronic, and lipophilic effects of substituents on the 4-benzyl moiety. An increase of lipophilicity, by replacement of the phenyl of the benzyl moiety in $\mathbf{4 a}$ with a naphth-1-yl (4b), was tolerated and maintained the percent reduction of cAMP production ( $51 \%$ and $58 \%$ of control, respectively). Introduction of either electron-releasing or electron-withdrawing groups at the para-position on the phenyl of the 4 -benzyl moiety ( $\mathbf{4 c} \mathbf{c} \mathbf{k}$ ) was found to have beneficial effects on the activity, producing an enhanced reduction of cAMP content compared with the unsubstituted benzyl analogue $\mathbf{4 a}$, with the 4 -( $p$-methoxybenzyl)thiophene $\mathbf{4 g}$ as one of the most active compounds.

Starting from the 4-benzyl-5-phenylthiophene derivative 4a, introduction of the electronwithdrawing fluorine atom (4c) increased the inhibition of cAMP production, which was further improved increasing the size of the halogen from fluorine to chlorine (4d). The presence of electron-releasing groups, such as methyl (4e) or methoxy ( $\mathbf{4 g}$ ), also enhanced potency relative to the unsubstituted 4-benzyl derivative $\mathbf{4 a}$, and this effect was more evident for $p$-methoxy derivative 4g. The position and the number of methoxy groups on the phenyl of the benzyl moiety had influence on the AE activity, which was reduced by moving the methoxy moiety from the para- to ortho-position (compound $\mathbf{4 m}$ ). Because the electronic properties of $\mathbf{4 g}$ and $\mathbf{4 m}$ are similar, the reduced activity seen with $\mathbf{4 m}$ is presumably due to steric factors, caused by the methoxy group at the ortho-position of the phenyl ring. Since the $p$-methoxy substitution of $\mathbf{4 g}$ was favorable for potency, we examined the effect on activity caused by the introduction of additional electronreleasing methyl or methoxy groups. The insertion of a second and especially, a third strongly electron-releasing methoxy group, to furnish the corresponding $o, p$-dimethoxy ( $\mathbf{4 p}$ ) and $m, m^{\prime}, p$ -
trimethoxy ( $\mathbf{4 q}$ ) derivatives, caused a reduction in the percent inhibition of cAMP production relative to $\mathbf{4 g}$. The reduction of potency was less pronounced by the introduction of one or two additional methyl moieties on the meta-positions, to furnish compounds $\mathbf{4 n}$ and $\mathbf{4 0}$, respectively, suggesting that the reduced activity observed with compounds 40-q may be accounted for largely by an increase in the steric hindrance at the ortho- and meta-positions on the phenyl of the 4 benzyl moiety.

Replacement of the weakly electron-releasing methyl group (4e) by the electron-withdrawing trifluoromethyl moiety (4f), with opposite electronic effects and a larger steric effect, caused a substantial increase in the inhibition of cAMP production. By substitution of the trifluoromethyl moiety in $\mathbf{4 f}$ with the bulkier trifluoromethoxy group ( $\mathbf{4 h}$ ) the AE activity was maintained.

In an effort to further understand the steric effects of the alkoxy substituent at the para-position of the 4-benzyl moiety, replacing the methoxy with the ethoxy homologue (4j) or a bulkier isopropoxy moiety $(\mathbf{4} \mathbf{k})$ largely maintained the potency. Replacement of the methoxy group with the electronically neutral, but more lipophilic and larger methylthio moiety resulted in derivative (4i) with somewhat reduced activity relative to $\mathbf{4 g}$.

Compounds $4 \mathbf{r}$-af examined the effect of adding an electron-withdrawing ( F and Cl ) or electronreleasing (methoxy) group in the para-position of the phenyl moiety at the C-5 position of the thiophene ring. In general, compounds that possessed a $p$-chlorophenyl group in the 5 -position ( $\mathbf{4 x} \mathbf{x}$ ab) showed greater activity than the corresponding compounds with a $p$-fluorophenyl or $p$ methoxyphenyl moiety at the C-5 position when the C-4 benzyl substituent was held constant (i.e. $4 \mathbf{x} v s .4 \mathbf{r}$ and $4 \mathbf{a c}, 4 \mathbf{y} v s .4 \mathbf{s}, \mathbf{4 z} v s .4 \mathrm{t}$ and $\mathbf{4 a d}, 4 \mathbf{a b} v s .4 \mathbf{v}$ and $\mathbf{4 a e})$. Interestingly, this analysis becomes more complicated when the corresponding compounds with an unsubstituted phenyl group at C-5 are included. If the C-4 benzyl moiety contains an electron-withdrawing substituent in the para-position, then the 5 -phenyl compounds ( $\mathbf{4 c}$ and $\mathbf{4 d}$ ) were found to have activities intermediate between the C-5 $p$-chlorophenyl ( $\mathbf{4} \mathbf{y}$ and $\mathbf{4 z}$ ) and $p$-fluorophenyl ( $\mathbf{4 s}$ and $4 \mathbf{t}$ ) derivatives. Comparing the $\mathrm{C}-5 p$-fluorophenylthiophene derivatives $\mathbf{4 r} \mathbf{r} \mathbf{v}$ with the $p$-chlorophenyl
counterparts $\mathbf{4 x} \mathbf{x} \mathbf{a b}$, it can be suggested that increasing the size of the halide leads to a large increase in the percent inhibition of cAMP production, from $45-59 \%$ to $69-81 \%$, with the greatest difference observed between $\mathbf{4 t}$ and $\mathbf{4 z}$. However, by including the derivatives bearing an unsubstituted phenyl at the C-5 position, it can be seen that factors beyond the steric bulk of the para-substituents are influencing AE activity. The results also showed that, with the notable exception of 4-(p-methylthiobenzyl) derivatives $\mathbf{4 i}, \mathbf{4 w}$ and $\mathbf{4 a f}$, the derivatives bearing a $p$ methoxyphenyl moiety at C-5 of the thiophene ring were generally less active than the corresponding phenyl and $p$-fluorophenyl counterparts (4ac vs. 4a and $\mathbf{4 r}$, $\mathbf{4 a d} v s$. $\mathbf{4 d}$ and $\mathbf{4 t}$, 4ae vs. $\mathbf{4 g}$ and $\mathbf{4 v}$ ).

Among the 5-(p-fluorophenyl)thiophene derivatives 4r-w, replacement of the p-methylbenzyl moiety at the 4 -position of the thiophene ring with a $p$-methoxybenzyl (compounds $\mathbf{4 u}$ and $\mathbf{4 v}$, respectively) had little effect on AE activity. However, replacing the electron-releasing $p$-methoxy or $p$-methyl groups on the C-4 benzyl with hydrogen (4r), the sterically more demanding, but electronically neutral methylthio group (4w), or an electron-withdrawing halogen ( F and Cl for $\mathbf{4 s}$ and $\mathbf{4 t}$, respectively) led to a reduction in activity, which was more evident for compound $\mathbf{4 s}$. In contrast, the potency of the 5-(p-methoxyphenyl)thiophene derivative with a 4-(pmethylthiobenzyl) moiety (4af) was substantially greater than seen with the derivatives containing benzyl (4ac), p-chlorobenzyl (4ad) or $p$-methoxybenzyl (4ae) groups. For the C-5 $p$ (chlorophenyl)thiophene analogues $\mathbf{4 x} \mathbf{- a b}$, the insertion of methyl or methoxy moieties on the para-position of the phenyl of the 4-benzyl moiety was tolerated and maintained the AE activity (compounds $\mathbf{4 a a}$ and $\mathbf{4 a b}$, respectively) relative to the unsubstituted benzyl derivative $\mathbf{4 x}$, while the presence of $p$-fluoro and $p$-chloro for the corresponding derivatives $\mathbf{4 y}$ and $\mathbf{4 z}$, was associated with increased AE activity.

The contribution of the phenyl and benzyl groups at the 4- and 5-positions of the 2-amino-3-( $p$ chlorobenzoyl)thiophene scaffold was clearly position dependent and their relative position was critical for the AE activity. Placing the benzyl group at the C-5 position of the thiophene ring
resulted in a series of compounds ( $\mathbf{5 a - i}$ ) which proved to be from 1.5 to 2.5 -fold less efficacious in inhibiting cAMP production than the corresponding isomeric 4-benzyl counterparts (i.e. 5a vs. 4a, $\mathbf{5 b} v s . \mathbf{4 b}, \mathbf{5 c} v s . \mathbf{4 f}, \mathbf{5 d} v s . \mathbf{4 g}, \mathbf{5 e} v s . \mathbf{4 l}, \mathbf{5 f} v s . \mathbf{4 h}, \mathbf{5 g} v s . \mathbf{4}, \mathbf{5 h} v s . \mathbf{4 k}, \mathbf{5 i} v s . \mathbf{4 n})$. It is clear that the AE activity is not regulated by the simple presence of hydrophobic groups, regardless of location, but by the presence of specific groups at specific positions. In summation, the SAR studies showed that the most active derivatives had a substituted benzyl along with a phenyl or a $p$-chlorophenyl in the 4- and 5-positions, respectively, on the 2-amino-3-(p-chlorobenzoylthiophene scaffold.

In comparing the effects of ERG's and EWG's on the phenyl of the benzyl moiety at the C-4 position of the thiophene ring, no consistent difference in influence on allosteric enhancement activity occurred. In fact, several compounds, characterized by the presence of substituents with opposite electronic effects, showed the same potency. For example, compound $\mathbf{4 f}$ containing the strongly electron-withdrawing trifluoromethyl group showed an activity little different from that of compound $\mathbf{4 g}$ containing the electron-releasing methoxy group.

Among the newly synthesized compounds $\mathbf{4 a}$-af and $\mathbf{5 a} \mathbf{- i}$, the most efficacious and potent derivative was $\mathbf{4 z}$, which possessed $p$-chlorobenzyl and $p$-chlorophenyl substituents in the 4 - and 5positions of 2-amino-3-(p-chlorobenzoyl)thiophene core, respectively. Comparing $\mathbf{4 z}$ to reference compounds 2a and 3a, each characterized by the presence of a common 2-amino-3-( $p$ -chlorobenzoyl)-5-(p-chlorophenyl)thiophene skeleton and differing only in their 4 -substituent, it appeared that replacing the 4 -neopentyl moiety of $\mathbf{3 a}$ with a $p$-chlorobenzyl $(\mathbf{4 z})$ led to a 1.5 -fold increase in the percent inhibition of cAMP, while $\mathbf{4 z}$ showed activity comparable to that of the 4 ( $p$-chlorophenyl)piperazin-1-ylmethylene derivative 2a. All of the 4-benzyl-5-arylthiophene derivatives $\mathbf{4 a}$ and $\mathbf{4 c}$-af were from 3- to 4 -fold more potent than PD 81,723 at the concentration tested and reduced the amount of cAMP production from $43 \%$ to $84 \%$. The isomeric 4-phenyl-5benzyl derivatives showed AE activity as high as that of PD 81,723, with several compounds (5d, 5e and 5i) having substantially higher activity.

### 3.2. Antagonistic activity.

The therapeutic potential of many of the currently available allosteric enhancers of agonist binding to the $\mathrm{hA}_{1} \mathrm{AR}$ can be hampered by several non-specific actions, which include the propensity to cause antagonism at the $\mathrm{A}_{1}$ adenosine receptor, especially at higher concentrations. The ability of compounds 4a-af and 5a-i to displace the binding of $\left[{ }^{3} \mathrm{H}\right]$ DPCPX, $\left.{ }^{3} \mathrm{H}\right]$ ZM 241385 and $\left[{ }^{3} \mathrm{H}\right]$ MRE-3008-F20 at human $\mathrm{A}_{1}, \mathrm{~A}_{2 \mathrm{~A}}$ and $\mathrm{A}_{3}$ ARs was evaluated in CHO cells at a concentration of $10 \mu \mathrm{M}$. The prototype enhancer PD 81,723 did not inhibit the binding of the radiolabeled antagonists to $\mathrm{A}_{1}$ and $\mathrm{A}_{2 \mathrm{~A}}$ ARs, but at $10 \mu \mathrm{M}$, it reduced by $21 \%$ the binding of $\left[{ }^{3} \mathrm{H}\right]$ MRE-3008-F20 to $\mathrm{hA}_{3}$ ARs [25]. None of the examined derivatives significantly inhibited the specific binding of the radioligands to $\mathrm{A}_{1}, \mathrm{~A}_{2 \mathrm{~A}}$ and $\mathrm{A}_{3}$ ARs, causing inhibition of radioligand binding of $10 \%$ or less (data not shown). For the most active compounds in functional assays, such as $\mathbf{4 f} \mathbf{- h}, \mathbf{4} \mathbf{j} \mathbf{n}$, and $\mathbf{4 x} \mathbf{- a b}$, it was possible to achieve a good separation between high efficacy in the inhibition of cAMP production and binding at the orthosteric site.

### 3.3. Effect of enhancers on $A_{1} A R$ binding parameters.

Saturation and competition experiments of the selective adenosine $\mathrm{A}_{1}$ agonist $\left[{ }^{3} \mathrm{H}\right] \mathrm{CCPA}$ to $\mathrm{A}_{1}$ receptors were performed to determine if the novel compounds modified the agonist binding parameters. From these experiments, $A_{1}$ receptor affinity $\left(K_{D}\right)$ and density (Bmax) were evaluated in the presence and in the absence of the examined compounds [PD 81,723 (1a), 2a, 3a, 4a-af, and $\mathbf{5 a - i}$ at a concentration of $10 \mu \mathrm{M}$ ] and were used to calculate the increase of $\mathrm{A}_{1}$ density (Bmax shift) (Table 2). The reference compound PD 81,723 induced a Bmax shift to human $\mathrm{A}_{1}$ adenosine receptors of 1.3 -fold. Under the same experimental conditions, all of the newly synthesized compounds were more potent than PD 81,723 . From the receptor density calculated in the presence and in the absence of the novel enhancers, the derivatives $\mathbf{4 b} \mathbf{- p}, \mathbf{4 t} \mathbf{- a b}, \mathbf{4 a e}$, and 4af were the most active compounds, each causing a Bmax shift of more than five-fold, with $\mathbf{4 z}$ causing an elevenfold shift. Figure 2 shows the effect of the allosteric modulators PD 81,723, $\mathbf{4 g}, \mathbf{4 j}$ and $\mathbf{4 z}$ at $10 \mu \mathrm{M}$
concentration in $\left[{ }^{3} \mathrm{H}\right]$ CCPA saturation binding experiments on $\mathrm{A}_{1} \mathrm{AR}$ binding parameters such as affinity and density. Interestingly, no differences were found in affinity values, suggesting that the enhancers were not able to modify the $\mathrm{K}_{\mathrm{D}}$ values of the high affinity binding sites labeled by $\left[{ }^{3} \mathrm{H}\right] \mathrm{CCPA}\left(\mathrm{K}_{\mathrm{D}}\right.$ ranged from $1.0 \pm 0.1$ to $\left.1.2 \pm 0.1\right)$.

Table 2 also reports the derived apparent affinity ( Ki ) values for CCPA, based on a one-state model of analysis, in the absence and in the presence of the tested enhancers. This table also shows the CCPA shift, representing the ratio of apparent Ki values in the absence and in the presence of the tested compounds at $10 \mu \mathrm{M}$ concentration. In the $\mathrm{hA}_{1} \mathrm{CHO}$ membranes, by using $\left[{ }^{3} \mathrm{H}\right] \mathrm{DPCPX}$ as radioligand, the Ki value of CCPA was $15.1 \pm 1.4 \mathrm{nM}$. Interestingly, a significant decrease in the apparent Ki value was due to the presence of the putative allosteric enhancers, suggesting an increase in the high-affinity binding sites. In the presence of PD 81,723 , the affinity of CCPA increased by 1.4 -fold. With the exception of compounds $\mathbf{5 b} \mathbf{- c}$ and $\mathbf{5} \mathbf{g}$, the CCPA affinity data in the presence of the newly synthesized derivatives $\mathbf{4 a}$-af and 5a-i reveals that the displacement curves are shifted left, suggesting even lower Ki values for CCPA. In particular, the largest affinity shift was observed for compounds $\mathbf{4 f} \mathbf{- g}, \mathbf{4} \mathbf{j}$ and $\mathbf{4 x} \mathbf{x}$. These molecules enhanced the apparent affinity of CCPA approximately from 8 - to 11 -fold, with the most active compound of the series being $\mathbf{4 z}$, which appeared three-fold more potent than the 4-neopentyl derivative 3a in this assay (Table 2). Comparing the CCPA affinity data of compounds $\mathbf{3 a}$ and $\mathbf{4 z}$, we hypothesize that the phenyl ring of the benzyl moiety may establish a $\pi-\pi$ interaction with a specific amino acid residue located in the hydrophobic domain at the allosteric site surrounding the C-4 position of the thiophene ring. Compound $\mathbf{4 z}$ also induced a higher apparent CCPA affinity than the corresponding arylpiperazine derivative 2a, with Ki values of $1.3 \pm 0.1$ and $1.8 \pm 0.1 \mathrm{nM}$, respectively. Thus, the enhancers were able to mediate a shift of the $\mathrm{A}_{1}$ receptors toward the high affinity state, as suggested by the increase of the CCPA affinity expressed as Ki values (Table 2). In Figure 3, representative binding curves for the displacement of $\left[{ }^{3} \mathrm{H}\right]$ DPCPX by different concentrations of CCPA alone and in the presence of PD $81,723, \mathbf{4 g}, \mathbf{4} \mathbf{j}$ and $\mathbf{4 z}$ at $10 \mu \mathrm{M}$ concentration are shown, demonstrating an
apparent increase of the CCPA binding affinity in the presence of these novel enhancers. Starting from the unsubstituted 4-benzyl derivative 4a, the addition of substituents with opposite electronic effects at the phenyl of the benzyl moiety, such as electron-withdrawing trifluoromethyl and electron-releasing methoxy moieties for compounds $\mathbf{4 f}$ and $\mathbf{4 g}$, respectively, resulted in a 2 -fold increase of apparent CCPA affinity. The results obtained from the competition and saturation experiments confirmed that most of the newly synthesized compounds had good enhancer activity at the $A_{1} A R$, in agreement with the data from the cAMP functional assay.

### 3.4. Effect of $4 z$ on kinetic parameters of agonist binding to $A_{l} A R$.

Association and dissociation experiments were performed on $\mathrm{hA}_{1} \mathrm{AR}$ with the agonist radioligand $\left[{ }^{3} \mathrm{H}\right]$ NECA. From these experiments, association and dissociation rates ( $\mathrm{k}_{\text {on }}$ and $\mathrm{k}_{\text {off }}$, respectively) were calculated in the presence and absence of PD81,723 and $\mathbf{4 z}$ at a concentration of $1 \mu \mathrm{M}$ (Fig. 4 and Table 3). Alteration of the dissociation kinetics of ligand binding from the orthosteric site indicates an allosteric effect by the added compound. PD81,723 was used as a reference allosteric modulator, which is known to enhance agonist binding at a concentration of $10 \mu \mathrm{M}$ [16a]. The association rate constant of $\left[{ }^{3} \mathrm{H}\right]$ NECA was not influenced by either $1 \mu \mathrm{M}$ PD81,723 or $\mathbf{4 z}$. The dissociation rate constant of [ $\left.{ }^{3} \mathrm{H}\right]$ NECA was not changed significantly by $1 \mu \mathrm{M}$ PD81,723 either. However, in the presence of $1 \mu \mathrm{M}$ of compound $\mathbf{4 z}$, the dissociation rate constant of $\left[{ }^{3} \mathrm{H}\right]$ NECA decreased by 2.5 -fold. Additionally, the affinity of $\left[{ }^{3} \mathrm{H}\right]$ NECA was derived from the association and dissociation rate constants, yielding the kinetic $K_{D}$. In the presence of $1 \mu \mathrm{MPD} 81,723$ the affinity of the radioligand was not changed, whereas in the presence of $1 \mu \mathrm{M} \mathbf{z z}$, the affinity of $\left[{ }^{3} \mathrm{H}\right]$ NECA increased by 2.3 -fold, These results confirm the allosteric enhancing effect of $\mathbf{4 z}$ on agonist binding at the $\mathrm{hA}_{1} \mathrm{AR}$.

### 3.5. Formalin assay.

To investigate the potential therapeutic properties of the novel $\mathrm{A}_{1} \mathrm{AR}$ allosteric enhancers, the most active compound of the series $(\mathbf{4 z})$ was also tested in the formalin test, a widely used model for the
study of nociception. Administration of $\mathbf{4 z}$ resulted in a significant suppression of pain behaviours relative to vehicle-treated mice at doses of 0.3 and $3 \mathrm{mg} / \mathrm{kg}$, with a peak inhibition of nociceptive responses of $49 \%$ and $82 \%$, respectively (Fig. 5). The data obtained in the formalin assay confirmed the potential anti-nociceptive effect of the novel $\mathrm{A}_{1} \mathrm{AR}$ allosteric enhancers.

## 4. Conclusions

In summary, two different regioisomeric series of 4,5-disubstituted 2-amino-3-( $p$-chlorobenzoyl) thiophene derivatives, with general structures $\mathbf{4}$ and 5, were prepared and evaluated as AEs at the $\mathrm{A}_{1}$ AR. These two series of analogues were designed to evaluate the effect of interchanging the benzyl and phenyl substituents at the C-4 and C-5 positions of the thiophene ring. Starting with an unsubstituted benzyl at C-4 and an unsubstituted phenyl at C-5 (4a), structural optimization was conducted by introducing a number of ERG's or EWG's on the phenyl group of the benzyl moiety at the C-4 position. A range of substituted phenyl groups in the C-5 position was also evaluated, with $\mathrm{R}_{5}$ as an unsubstituted, $p$-fluoro, $p$-chloro, or $p$-methoxy phenyl. The data show no clear steric or electronic effects for substituents on the benzyl moiety at C-4, except that the introduction of substituents in the ortho- or meta-position or the presence of multiple substituents on the phenyl ring of the benzyl group led to the least active compounds $\mathbf{4 1}, \mathbf{4 m}$, and $\mathbf{4 0} \mathbf{- q}$.

We have also shown that the appropriate orientation of substituents at the 4- and 5-positions of the thiophene nucleus was fundamental to the AE activity. The relative positions of the benzyl and phenyl moieties on the 2-amino-3-(p-chlorobenzoyl)thiophene scaffold were critical for optimal AE activity, with the 4-benzyl-5-arylthiophene derivatives more potent than 4-aryl-5benzylthiophene counterparts. This may suggest that the introduction of a methylene spacer between the phenyl ring and the 5-position of the thiophene nucleus was detrimental for the AE activity.

A characteristic feature of many AEs at the $\mathrm{A}_{1} \mathrm{AR}$ is a propensity to cause antagonism at higher concentrations. None of the new synthesized molecules 4a-af and 5a-i significantly inhibited antagonist binding at the $\mathrm{hA}_{1} \mathrm{AR}, \mathrm{hA}_{2} \mathrm{AR}$, or $\mathrm{hA}_{3} \mathrm{AR}$. Among these, derivatives $\mathbf{4 f} \mathbf{- g}, \mathbf{4} \mathbf{j}$ and $\mathbf{4 x} \mathbf{- a} \mathbf{a}$
were the most active compounds in binding (saturation and displacement) experiments and functional cAMP assays. Compound $\mathbf{4 z}$ slowed agonist dissociation from the $\mathrm{hA}_{1} \mathrm{AR}$, without affecting agonist association, confirming its allosteric enhancing effect on this receptor. When tested in the formalin assay, compound $\mathbf{4 z}$ showed a good anti-nociceptive effect, confirming that AEs at the $\mathrm{A}_{1} \mathrm{AR}$ could be useful in pain modulation.

## 5. Experimental Section

### 5.1. Chemistry.

### 5.1.1. Materials and Methods.

${ }^{1} \mathrm{H}$-NMR and ${ }^{13} \mathrm{C}$-NMR spectra were determined in $\mathrm{CDCl}_{3}$ or $d_{6}$-DMSO solutions and recorded with a Varian VXR-200 spectrometer or a Varian Mercury Plus 400 spectrometer. Chemical shifts ( $\delta$ ) are given in parts per million ( ppm ) downfield and $J$ values are given in hertz. Positive-ion electrospray ionization (ESI) mass spectra were recorded on a double-focusing ESI Micromass ZMD 2000 mass spectrometer. Melting points (mp) were determined on a Buchi-Tottoli apparatus and are uncorrected. Elemental analyses were conducted by the Microanalytical Laboratory of the Chemistry Department of the University of Ferrara and were performed on a Yanagimoto MT-5 CHN recorder analyzer. All tested compounds yielded data consistent with a purity of at least $95 \%$ as compared with the theoretical values. All reactions were performed under an inert atmosphere of dry nitrogen, unless otherwise described. Reaction courses and product mixtures were routinely monitored by TLC on silica gel (precoated F254 Merck plates) and visualized with aqueous $\mathrm{KMnO}_{4}$. Flash chromatography was performed using 230-400 mesh silica gel and the solvent system indicated in the procedure. All commercially available compounds were used without further purification. Organic solutions were dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$. Petroleum ether refers to the fraction boiling at $40-60^{\circ} \mathrm{C}$.
5.1.2. General procedure (A) for the synthesis of compounds 7a-af and 11a-i.

A mixture of thiophene derivatives $\mathbf{6 a - d}$ or $\mathbf{1 0}(1 \mathrm{mmol}), \mathrm{K}_{2} \mathrm{CO}_{3}(207 \mathrm{mg}, 1.5 \mathrm{mmol}, 1.5$ equiv. $)$, the appropriate aryl boronic acid ( $2 \mathrm{mmol}, 2$ equiv.) and tetrakis(triphenylphosphine)palladium (28 $\mathrm{mg}, 0.024 \mathrm{mmol})$ in dry toluene $(10 \mathrm{~mL})$ was stirred at $100^{\circ} \mathrm{C}$ under nitrogen for 18 h . After cooling to room temperature, the reaction mixture was diluted with methylene chloride ( 10 mL ), filtered through a pad of Celite, and the combined filtrates concentrated. The residue was dissolved with methylene chloride ( 20 mL ), and the resulting solution was washed sequentially with $5 \%$ $\mathrm{NaHCO}_{3}(5 \mathrm{~mL})$, water ( 5 mL ), and brine ( 5 mL ). The organic layer was dried, filtered, and evaporated, and the residue was purified by flash chromatography on silica gel.

### 5.1.2.1. 2-[4-Benzyl-3-(4-chlorobenzoyl)-5-phenyl-2-thienyl]-1H-isoindole-1,3(2H)-dione <br> (7a).

 Following general procedure A, after workup as described previously, the crude residue was purified by column chromatography on silica gel (eluent EtOAc-petroleum ether 1.5-8.5), to furnish the desired product $\mathbf{7 a}$ as a yellow solid. Yield: $71 \%, \mathrm{mp} 195-196{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H} \operatorname{NMR}\left(\mathrm{CDCl}_{3}\right) \delta: 4.18$ (s, 2H), $6.91(\mathrm{~d}, \mathrm{~J}=8.6 \mathrm{~Hz}, 2 \mathrm{H}), 7.05(\mathrm{~m}, 2 \mathrm{H}), 7.08(\mathrm{~d}, \mathrm{~J}=8.6 \mathrm{~Hz}, 2 \mathrm{H}), 7.43(\mathrm{~m}, 4 \mathrm{H}), 7.53(\mathrm{~m}, 4 \mathrm{H}), 7.72$ $(\mathrm{m}, 4 \mathrm{H}) . \mathrm{MS}(\mathrm{ESI}):[\mathrm{M}+1]^{+}=535.2$.5.1.2.2. 2-[3-(4-Chlorobenzoyl)-4-(1-naphthylmethyl)-5-phenyl-2-thienyl]-1H-isoindole-1,3(2H)dione ( $7 b$ ). Following general procedure A , after workup as described previously, the crude residue purified by column chromatography (eluent ethyl ether), furnished the desired product $7 \mathbf{b}$ as a colour cream solid. Yield: $79 \%$, mp 253- $255{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta: 4.61(\mathrm{~s}, 2 \mathrm{H}), 6.96(\mathrm{~d}, \mathrm{~J}=8.4$ $\mathrm{Hz}, 2 \mathrm{H}), 7.10(\mathrm{~d}, \mathrm{~J}=7.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.22(\mathrm{~d}, \mathrm{~J}=7.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.28(\mathrm{~d}, \mathrm{~J}=8.8 \mathrm{~Hz}, 2 \mathrm{H}), 7.35$ (d, J=8.8 Hz, $2 \mathrm{H}), 7.42(\mathrm{~m}, 8 \mathrm{H}), 7.75(\mathrm{~m}, 4 \mathrm{H}) . \mathrm{MS}(\mathrm{ESI}):[\mathrm{M}+1]^{+}=585.1$.
5.1.2.3. 2-[3-(4-Chlorobenzoyl)-4-(4-fluorobenzyl)-5-phenyl-2-thienyl]-1H-isoindole-1,3(2H)-dione (7c). Following general procedure A, after workup as described previously, the crude residue purified by column chromatography (eluent EtOAc-petroleum ether 3-7), furnished the desired product 7 c as a white solid. Yield: $67 \%, \mathrm{mp} 74-76{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta: 4.14(\mathrm{~s}, 2 \mathrm{H}), 6.74(\mathrm{~m}$,
$4 \mathrm{H}), 7.10(\mathrm{~d}, \mathrm{~J}=8.8 \mathrm{~Hz}, 2 \mathrm{H}), 7.43$ (d, J=8.8 Hz, 2H), 7.51 (m, 5H), 7.76 (m, 4H). MS (ESI): $[\mathrm{M}+1]^{+}=553.1$
5.1.2.4. 2-[3-(4-Chlorobenzoyl)-4-(4-chlorobenzyl)-5-phenyl-2-thienyl]-1H-isoindole-1,3(2H)dione (7d). Following general procedure A , after workup as described previously, the crude residue purified by column chromatography (eluent EtOAc-petroleum ether 2-8), furnished the desired product 7d as a yellow oil. Yield: $57 \%$. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta: 4.13(\mathrm{~s}, 2 \mathrm{H}), 6.82(\mathrm{~d}, \mathrm{~J}=8.6 \mathrm{~Hz}, 2 \mathrm{H})$, 7.02 (d, J=8.6 Hz, 2H), 7.10 (d, J=8.6 Hz, 2H), 7.43 (m, 7H), 7.75 (m, 4H). MS (ESI): $[\mathrm{M}+1]^{+}=569.5$.

### 5.1.2.5. 2-[3-(4-Chlorobenzoyl)-4-(4-methylbenzyl)-5-phenyl-2-thienyl]-1H-isoindole-1,3(2H)-

 dione (7e). Following general procedure A , after workup as described previously, the crude residue purified by column chromatography (eluent EtOAc-petroleum ether 1.5-8.5), furnished the desired product 7e as a yellow solid. Yield: $63 \%, \mathrm{mp} 118-120{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H} \operatorname{NMR}\left(\mathrm{CDCl}_{3}\right) \delta: 2.15(\mathrm{~s}, 3 \mathrm{H}), 4.12$ (s, 2H), 6.77 (d, J=8.8 Hz, 2H), 6.83 (d, J=8.8 Hz, 2H), $7.10(\mathrm{~d}, \mathrm{~J}=8.8 \mathrm{~Hz}, 2 \mathrm{H}), 7.41(\mathrm{~d}, \mathrm{~J}=8.8 \mathrm{~Hz}$, $2 \mathrm{H}), 7.44(\mathrm{~m}, 3 \mathrm{H}), 7.52(\mathrm{~m}, 2 \mathrm{H}), 7.75(\mathrm{~m}, 4 \mathrm{H}) . \mathrm{MS}(\mathrm{ESI}):[\mathrm{M}+1]^{+}=549.2$.5.1.2.6. 2-\{3-(4-Chlorobenzoyl)-5-phenyl-4-[4-(trifluoromethyl)benzyl]-2-thienyl\}-1H-isoindole-1,3(2H)-dione (7f). Following general procedure A, after workup as described previously, the crude residue purified by column chromatography (eluent EtOAc-petroleum ether 2-8), furnished the desired product 7 f as a yellow oil. Yield: $95 \% .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta: 4.22(\mathrm{~s}, 2 \mathrm{H}), 6.92(\mathrm{~d}, \mathrm{~J}=8.4 \mathrm{~Hz}$, $2 \mathrm{H}), 7.11(\mathrm{~d}, \mathrm{~J}=8.4 \mathrm{~Hz}, 2 \mathrm{H}), 7.26(\mathrm{~d}, \mathrm{~J}=8.8, \mathrm{~Hz}, 2 \mathrm{H}), 7.38(\mathrm{~d}, \mathrm{~J}=8.8 \mathrm{~Hz}, 2 \mathrm{H}), 7.48(\mathrm{~m}, 5 \mathrm{H}), 7.73(\mathrm{~m}$, $4 \mathrm{H})$. $\mathrm{MS}(\mathrm{ESI}):[\mathrm{M}+1]^{+}=603.1$.
5.1.2.7. 2-[3-(4-Chlorobenzoyl)-4-(4-methoxybenzyl)-5-phenyl-2-thienyl]-1H-isoindole-1,3(2H)dione ( 7 g ). Following general procedure A , after workup as described previously, the crude residue purified purified by column chromatography (eluent EtOAc-petroleum ether 2-8), furnished the desired product 7 g as a white solid. Yield $73 \%$, mp $83-85{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta: 3.65(\mathrm{~s}, 3 \mathrm{H})$,
4.09 (s, 2H), $6.60(\mathrm{~d}, \mathrm{~J}=8.0 \mathrm{~Hz}, 2 \mathrm{H}), 6.76$ (d, J=8.0 Hz, 2H), $7.10(\mathrm{~d}, \mathrm{~J}=8.8 \mathrm{~Hz}, 2 \mathrm{H}), 7.43$ (d, J=7.6 $\mathrm{Hz}, 2 \mathrm{H}), 7.44(\mathrm{~m}, 5 \mathrm{H}), 7.76(\mathrm{~m}, 4 \mathrm{H}) . \mathrm{MS}(\mathrm{ESI}):[\mathrm{M}+1]^{+}=565.2$.
5.1.2.8. 2-\{3-(4-Chlorobenzoyl)-5-phenyl-4-[4-(trifluoromethoxy)benzyl]-2-thienyl\}-1H-isoindole-1,3(2H)-dione (7h). Following general procedure A, after workup as described previously, the crude residue purified by column chromatography (eluent EtOAc-petroleum ether 1.5-8.5), furnished the desired product $7 \mathbf{h}$ as a white solid. Yield $83 \%, \mathrm{mp} 154-156{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta: 4.17(\mathrm{~s}, 2 \mathrm{H})$, 6.89 (d, J=8.0 Hz, 2H), 7.06 (d, J=8.0 Hz, 2H), 7.36 (d, J=8.8 Hz, 2H), 7.44 (m, 7H), 7.76 (m, 4H). MS (ESI): $[\mathrm{M}+1]^{+}=619.1$.
5.1.2.9. 2-[3-(4-Chlorobenzoyl)-4-(4-methylthiobenzyl)-5-phenyl-2-thienyl]-1H-isoindole-1,3(2H)dione (7i). Following general procedure A, after workup as described previously, the crude residue purified by column chromatography (eluent EtOAc-petroleum ether 1.5-8.5), furnished the desired product $7 \mathbf{i}$ as a yellow solid. Yield $84 \%, \mathrm{mp} 187-189{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta: 2.33(\mathrm{~s}, 3 \mathrm{H}), 4.11(\mathrm{~s}$, 2H), 6.82 (d, J=8.4 Hz, 2H), 6.93 (d, J=8.4 Hz, 2H), 7.09 (d, J=8.6 Hz, 2H), 7.44 (d, J=8.6 Hz, 2H), $7.44(\mathrm{~m}, 5 \mathrm{H}), 7.73(\mathrm{~m}, 4 \mathrm{H}) . \mathrm{MS}(\mathrm{ESI}):[\mathrm{M}+1]^{+}=581.2$.
5.1.2.10. 2-[3-(4-Chlorobenzoyl)-4-(4-ethoxybenzyl)-5-phenyl-2-thienyl]-1H-isoindole-1,3(2H)dione (7j). Following general procedure A, after workup as described previously, the crude residue purified by column chromatography (eluent EtOAc-petroleum ether 2-8), furnished the desired product $7 \mathbf{j}$ as a white solid. Yield: $68 \%, \mathrm{mp} 89-90{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta: 1.29(\mathrm{t}, \mathrm{J}=7.2 \mathrm{~Hz}, 3 \mathrm{H})$, 3.85 ( $\mathrm{q}, \mathrm{J}=7.2 \mathrm{~Hz}, 2 \mathrm{H}$ ), $4.08(\mathrm{~s}, 2 \mathrm{H}), 6.55(\mathrm{~d}, \mathrm{~J}=8.8 \mathrm{~Hz}, 2 \mathrm{H}), 6.75(\mathrm{~d}, \mathrm{~J}=8.8 \mathrm{~Hz}, 2 \mathrm{H}), 7.08(\mathrm{~d}, \mathrm{~J}=8.8$ $\mathrm{Hz}, 2 \mathrm{H}), 7.42(\mathrm{~d}, \mathrm{~J}=8.8 \mathrm{~Hz}, 2 \mathrm{H}), 7.44(\mathrm{~m}, 5 \mathrm{H}), 7.72(\mathrm{~m}, 4 \mathrm{H}) . \mathrm{MS}(\mathrm{ESI}):[\mathrm{M}+1]^{+}=579.1$.
5.1.2.11. 2-[3-(4-Chlorobenzoyl)-4-(4-isopropoxybenzyl)-5-phenyl-2-thienyl]-1H-isoindole-1,3(2H)-dione (7k). Following general procedure A, after workup as described previously, the crude residue purified by column chromatography (eluent EtOAc-petroleum ether 1.5-8.5), furnished the desired product $7 \mathbf{k}$ as a white solid. Yield $81 \%, \mathrm{mp} 99-101{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta: 1.17(\mathrm{~d}, \mathrm{~J}=6.2$
$\mathrm{Hz}, 6 \mathrm{H}), 4.08(\mathrm{~s}, 2 \mathrm{H}), 4.34(\mathrm{~m}, 1 \mathrm{H}), 6.52(\mathrm{~d}, \mathrm{~J}=8.6 \mathrm{~Hz}, 2 \mathrm{H}), 6.73(\mathrm{~d}, \mathrm{~J}=8.6 \mathrm{~Hz}, 2 \mathrm{H}), 7.05(\mathrm{~d}, \mathrm{~J}=8.6$ $\mathrm{Hz}, 2 \mathrm{H}), 7.44(\mathrm{~d}, \mathrm{~J}=8.6 \mathrm{~Hz}, 2 \mathrm{H}), 7.53(\mathrm{~m}, 5 \mathrm{H}), 7.75(\mathrm{~m}, 4 \mathrm{H}) . \mathrm{MS}(\mathrm{ESI}):[\mathrm{M}+1]^{+}=593.3$.
5.1.2.12. 2-[3-(4-Chlorobenzoyl)-4-(3-methoxybenzyl)-5-phenyl-2-thienyl]-1H-isoindole-1,3(2H)dione ( $7 l$ ). Following general procedure A , after workup as described previously, the crude residue purified by column chromatography (eluent EtOAc-petroleum ether 1.5-8.5), furnished the desired product 71 as a white solid. Yield $72 \%, \mathrm{mp} 180-182{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta: 3.59(\mathrm{~s}, 3 \mathrm{H}), 4.14(\mathrm{~s}$, 2H), 6.48 (m, 2H), 6.96 (t, J=8.4 Hz, 1H), 7.10 (d, J=8.2 Hz, 2H), 7.42 (d, J=8.2 Hz, 2H), 7.45 (m, $4 \mathrm{H}), 7.51(\mathrm{~m}, 2 \mathrm{H}), 7.75(\mathrm{~m}, 4 \mathrm{H})$. $\mathrm{MS}(\mathrm{ESI}):[\mathrm{M}+1]^{+}=565.3$.
5.1.2.13. 2-[3-(4-Chlorobenzoyl)-4-(2-methoxybenzyl)-5-phenyl-2-thienyl]-1H-isoindole-1,3(2H)dione ( 7 m ). Following general procedure A, after workup as described previously, the crude residue purified by column chromatography (eluent EtOAc-petroleum ether 1.5-8.5), furnished the desired product $\mathbf{7 m}$ as a yellow solid. Yield $67 \%, \mathrm{mp} 223-225{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H} \operatorname{NMR}\left(\mathrm{CDCl}_{3}\right) \delta: 3.54(\mathrm{~s}, 3 \mathrm{H}), 4.02$ (s, 2H), 6.63 (t, J=8.4 Hz, 1H), 6.78 (d, J=8.4 Hz, 2H), $7.00(\mathrm{~m}, 1 \mathrm{H}), 7.32(\mathrm{~d}, \mathrm{~J}=8.4 \mathrm{~Hz}, 2 \mathrm{H}), 7.39$ $(\mathrm{d}, \mathrm{J}=8.4 \mathrm{~Hz}, 2 \mathrm{H}), 7.52(\mathrm{~m}, 5 \mathrm{H}), 7.83(\mathrm{~m}, 4 \mathrm{H}) . \mathrm{MS}(\mathrm{ESI}):[\mathrm{M}+1]^{+}=565.2$.
5.1.2.14. 2-[3-(4-Chlorobenzoyl)-4-(4-methoxy-3-methylbenzyl)-5-phenyl-2-thienyl]-1H-isoindole-1,3(2H)-dione (7n). 5.1.2.39. 2-[3-(4-Chlorobenzoyl)-5-(4-ethoxybenzyl)-4-phenyl-2-thienyl]-1H-isoindole-1,3(2H)dione (llg). Following general procedure A, after workup as described previously, the crude residue purified by column chromatography (eluent EtOAc-petroleum ether 1.5-8.5), furnished the desired product $\mathbf{1 1 g}$ as a yellow oil. Yield $42 \% .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta: 1.26(\mathrm{t}, \mathrm{J}=7.2 \mathrm{~Hz}, 3 \mathrm{H}), 4.04(\mathrm{q}$, $\mathrm{J}=7.2 \mathrm{~Hz}, 2 \mathrm{H}), 4.08(\mathrm{~s}, 2 \mathrm{H}), 6825(\mathrm{~d}, \mathrm{~J}=8.8 \mathrm{~Hz}, 2 \mathrm{H}), 6.88(\mathrm{~d}, \mathrm{~J}=8.8 \mathrm{~Hz}, 2 \mathrm{H}), 7.11(\mathrm{~d}, \mathrm{~J}=8.8 \mathrm{~Hz}, 2 \mathrm{H})$, $7.22(\mathrm{~d}, \mathrm{~J}=8.8 \mathrm{~Hz}, 2 \mathrm{H}), 7.36(\mathrm{~m}, 5 \mathrm{H}), 7.67(\mathrm{~m}, 4 \mathrm{H}) . \mathrm{MS}(\mathrm{ESI}):[\mathrm{M}+1]^{+}=579.1$.
5.1.2.40. 2-[3-(4-Chlorobenzoyl)-5-(4-isopropoxybenzyl)-4-phenyl-2-thienyl]-1H-isoindole-1,3(2H)-dione (11h). Following general procedure A, after workup as described previously, the crude residue purified by column chromatography (eluent EtOAc-petroleum ether 1.5-8.5), furnished the desired product $\mathbf{1 1 h}$ as a yellow oil. Yield $43 \% .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta: 0.88(\mathrm{~d}, \mathrm{~J}=6.2$ $\mathrm{Hz}, 6 \mathrm{H}), 4.03(\mathrm{~s}, 2 \mathrm{H}), 6.74(\mathrm{~m}, 3 \mathrm{H}), 6.85(\mathrm{~d}, \mathrm{~J}=8.6 \mathrm{~Hz}, 2 \mathrm{H}), 7.09(\mathrm{~d}, \mathrm{~J}=8.6 \mathrm{~Hz}, 2 \mathrm{H}), 7.17(\mathrm{~m}, 3 \mathrm{H})$, $7.55(\mathrm{~d}, \mathrm{~J}=8.8 \mathrm{~Hz}, 2 \mathrm{H}), 7.74(\mathrm{~m}, 4 \mathrm{H}) . \mathrm{MS}(\mathrm{ESI}):[\mathrm{M}+1]^{+}=593.2$.
5.1.2.41. 2-[3-(4-Chlorobenzoyl)-5-(4-methoxy-3-methylbenzyl)-4-phenyl-2-thienyl]-1H-isoindole-1,3(2H)-dione (1li). Following general procedure A, after workup as described previously, the crude residue purified by column chromatography (eluent EtOAc-petroleum ether 1.5-8.5), furnished the desired product $\mathbf{1 1 i}$ as a yellow oil. Yield $38 \%$. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta: 2.19(\mathrm{~s}, 3 \mathrm{H}), 3.82$ $(\mathrm{s}, 3 \mathrm{H}), 4.01(\mathrm{~s}, 2 \mathrm{H}), 6.78(\mathrm{~d}, \mathrm{~J}=7.2 \mathrm{~Hz}, 1 \mathrm{H}), 6.98(\mathrm{~m}, 2 \mathrm{H}), 7.09(\mathrm{~d}, \mathrm{~J}=8.4 \mathrm{~Hz}, 2 \mathrm{H}), 7.20(\mathrm{~m}, 5 \mathrm{H})$, $7.54(\mathrm{~d}, \mathrm{~J}=8.6 \mathrm{~Hz}, 2 \mathrm{H}), 7.82(\mathrm{~m}, 4 \mathrm{H}) . \mathrm{MS}(\mathrm{ESI}):[\mathrm{M}+1]^{+}=579.1$.
5.1.3. General procedure (B) for the synthesis of compounds $4 a-a f$ and $5 a-i$.

A stirred suspension of thiophene derivatives 7a-af or 11a-i $(0.5 \mathrm{mmol})$ and hydrazine monohydrate ( $29 \mu \mathrm{~L}, 0.6 \mathrm{mmol}, 1.2$ equiv.) in absolute $\mathrm{EtOH}(10 \mathrm{~mL})$ was heated at reflux for 1 h . The solvent was evaporated, and the residue partitioned between $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{~mL})$ and water $(5 \mathrm{~mL})$. The organic phase was washed with brine $(2 \mathrm{~mL})$, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, and concentrated in vacuo to obtain a residue that was purified by column chromatography on silica gel.
5.1.3.1. [2-Amino-4-benzyl-5-phenyl-3-thienyl](4-chlorophenyl)methanone (4a). Following the general procedure B , the residue was purified by column chromatography, eluting with EtOAcpetroleum ether 2-8, to yield the desired product 4a as a yellow solid. Yield $68 \%, \mathrm{mp} 134-135{ }^{\circ} \mathrm{C}$. ${ }^{1} \mathrm{H}$ NMR ( $d_{6}$-DMSO) $\delta: 3.67(\mathrm{~s}, 2 \mathrm{H}), 6.49(\mathrm{~d}, \mathrm{~J}=8.0 \mathrm{~Hz}, 2 \mathrm{H}), 7.04(\mathrm{~m}, 3 \mathrm{H}), 7.28(\mathrm{~m}, 3 \mathrm{H}), 7.39(\mathrm{~m}$, $6 \mathrm{H}), 7.66$ (bs, 2 H ). ${ }^{13} \mathrm{C}$-NMR ( $d_{6}$-DMSO) $\delta: 33.46,114.19,120.81,125.58$ (2C), 127.31 (2C), 127.84 (2C), 127.90 (2C), 128.70 (2C), 129.05 (2C), 129.73 (2C), 131.35, 133.53, 135.39, 139.07, 139.59, 164.18, 190.11. MS (ESI): $[\mathrm{M}+1]^{+}=404.9$. Anal. calcd for $\mathrm{C}_{24} \mathrm{H}_{18}$ CINOS: C, $71.36 ; \mathrm{H}, 4.49$; N, 3.47; found: C, 71.23; H, 4.25; N, 3.32.

### 5.1.3.2. (2-Amino-4-(1-naphthylmethyl)-5-phenyl-3-thienyl)(4-chlorophenyl)methanone

Following the general procedure B, the residue was purified by column chromatography, eluting with EtOAc-petroleum ether 1.5-8.5, to furnish the desired product 4b as a yellow solid. Yield 91\%, mp 178-180 ${ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta: 4.07(\mathrm{~s}, 2 \mathrm{H}), 6.67(\mathrm{bs}, 2 \mathrm{H}), 6.74(\mathrm{~d}, \mathrm{~J}=8.8 \mathrm{~Hz}, 2 \mathrm{H}), 6.83(\mathrm{~d}$, $\mathrm{J}=8.8 \mathrm{~Hz}, 2 \mathrm{H}), 6.84(\mathrm{~d}, \mathrm{~J}=7.2 \mathrm{~Hz}, 1 \mathrm{H}), 6.94(\mathrm{~d}, \mathrm{~J}=7.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.33(\mathrm{~m}, 8 \mathrm{H}), 7.63(\mathrm{~d}, \mathrm{~J}=7.2 \mathrm{~Hz}, 1 \mathrm{H})$, 7.74 (d, $\mathrm{J}=7.2 \mathrm{~Hz}, 1 \mathrm{H}$ ). MS (ESI): $[\mathrm{M}+1]^{+}=455.0$. Anal. calcd for $\mathrm{C}_{28} \mathrm{H}_{20} \mathrm{ClNOS}: \mathrm{C}, 74.08 ; \mathrm{H}, 4.44$; N, 3.09; found: C, 73.83; H, 4.26; N, 2.94.

### 5.1.3.3. [2-Amino-4-(4-fluorobenzyl)-5-phenyl-3-thienyl](4-chlorophenyl)methanone

(4c).
Following the general procedure B , the residue was purified by column chromatography, eluting with EtOAc-petroleum ether 2-8, to furnish the desired product $\mathbf{4 c}$ as a yellow oil. Yield $72 \%$. ${ }^{1} \mathrm{H}$ NMR ( $\mathrm{CDCl}_{3}$ ) $\delta: 3.67(\mathrm{~s}, 2 \mathrm{H}), 6.36(\mathrm{bs}, 2 \mathrm{H}), 6.48(\mathrm{dd}, \mathrm{J}=8.8$ and $1.2 \mathrm{~Hz}, 2 \mathrm{H}), 6.74(\mathrm{t}, \mathrm{J}=8.8 \mathrm{~Hz}$, $2 \mathrm{H}), 7.28(\mathrm{~d}, \mathrm{~J}=8.6 \mathrm{~Hz}, 2 \mathrm{H}), 7.36(\mathrm{~m}, 7 \mathrm{H})$. MS (ESI): $[\mathrm{M}+1]^{+}=422.9$. Anal. calcd for $\mathrm{C}_{24} \mathrm{H}_{17} \mathrm{ClFNOS}: \mathrm{C}, 68.32$; H, 4.06; N, 3.32; found: C, 68.21; H, 3.94; N, 3.23.
5.1.3.4. [2-Amino-4-(4-chlorobenzyl)-5-phenyl-3-thienyl](4-chlorophenyl)methanone (4d).

Following the general procedure B, the residue was purified by column chromatography, eluting with EtOAc-petroleum ether 2-8, to furnish the desired product 4d as a yellow solid. Yield $72 \%$, mp 83-85 ${ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR ( $d_{6}$-DMSO) $\delta: 3.65(\mathrm{~s}, 2 \mathrm{H}), 6.51(\mathrm{~d}, \mathrm{~J}=8.4 \mathrm{~Hz}, 2 \mathrm{H}), 7.11(\mathrm{~d}, \mathrm{~J}=8.4 \mathrm{~Hz}, 2 \mathrm{H})$,
$7.30(\mathrm{dd}, \mathrm{J}=8.0$ and $1.2 \mathrm{~Hz}, 2 \mathrm{H}), 7.35(\mathrm{~m}, 2 \mathrm{H}), 7.40(\mathrm{~m}, 5 \mathrm{H}), 7.67(\mathrm{bs}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}-\mathrm{NMR}\left(d_{6}\right.$-DMSO) $\delta: 32.93,114.03,121.09,127.36,127.78$ (2C), 127.97 (2C), 128.74 (2C), 129.01 (2C), 129.12 (2C), 129.74 (2C), 130.15, 130.83, 133.37, 135.50, 138.66, 138.96, 164.27, 190.00. MS (ESI): $[\mathrm{M}+1]^{+}=439.4$. Anal. calcd for $\mathrm{C}_{24} \mathrm{H}_{17} \mathrm{Cl}_{2} \mathrm{NOS}: \mathrm{C}, 65.76 ; \mathrm{H}, 3.91 ; \mathrm{N}, 3.20$; found: $\mathrm{C}, 65.58 ; \mathrm{H}, 3.77$; N, 3.05.

### 5.1.3.5. [2-Amino-4-(4-methylbenzyl)-5-phenyl-3-thienyl](4-chlorophenyl)methanone <br> (4e).

Following the general procedure B , the residue was purified by column chromatography, eluting with EtOAc-petroleum ether 2-8, to furnish the desired product 4 e as a yellow solid. Yield $57 \%, \mathrm{mp}$ $60-62{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR ( $d_{6}$-DMSO) $\delta: 2.14(\mathrm{~s}, 3 \mathrm{H}), 3.59(\mathrm{~s}, 2 \mathrm{H}), 6.36(\mathrm{~d}, \mathrm{~J}=8.0 \mathrm{~Hz}, 2 \mathrm{H}), 6.84(\mathrm{~d}, \mathrm{~J}=8.0$ $\mathrm{Hz}, 2 \mathrm{H}), 7.28(\mathrm{~d}, \mathrm{~J}=8.4 \mathrm{~Hz}, 2 \mathrm{H}), 7.35(\mathrm{~m}, 5 \mathrm{H}), 7.38(\mathrm{~d}, \mathrm{~J}=8.4 \mathrm{~Hz}, 2 \mathrm{H}), 7.60(\mathrm{bs}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}-\mathrm{NMR}\left(d_{6^{-}}\right.$ DMSO) $\delta: 20.98,33.56,114.82,121.22,127.76$ (2C), 127.92, 129.47 (2C), 128.99 (2C), 129.25 (2C), 129.54 (2C), 130.37 (2C), 132.18, 134.12, 135.04, 135.99, 137.08, 139.63, 164.59, 190.68. MS (ESI): $[\mathrm{M}+1]^{+}=418.9$. Anal. calcd for $\mathrm{C}_{25} \mathrm{H}_{20}$ ClNOS: C, 71.84 ; H, 4.82; N, 3.35; found: C, 71.68; H, 4.59; N, 3.21.
5.1.3.6. \{2-Amino-5-phenyl-4-[4-(trifluoromethyl)benzyl]-3-thienyl\}(4-chlorophenyl)methanone (4f). Following the general procedure B, the residue was purified by column chromatography, eluting with EtOAc-petroleum ether 2-8, to yield the desired product $\mathbf{4 f}$ as a yellow solid. Yield $66 \%, \mathrm{mp} 72-74{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR ( $d_{6}$-DMSO) $\delta: 3.75(\mathrm{~s}, 3 \mathrm{H}), 6.72(\mathrm{~d}, \mathrm{~J}=8.0 \mathrm{~Hz}, 2 \mathrm{H}), 7.26(\mathrm{~m}, 2 \mathrm{H}), 7.34$ $(\mathrm{m}, 6 \mathrm{H}), 7.39(\mathrm{~d}, \mathrm{~J}=8.0 \mathrm{~Hz}, 2 \mathrm{H}), 7.67(\mathrm{bs}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, d_{6}$-DMSO) $\delta: 33.78,114.28$, $121.61,123.09,124.92,127.66$ (2C), 128.19 (2C), 128.32 (2C), 129.01 (2C), 129.25 (2C), 129.91 (2C), 130.58, 133.56, 135.75, 139.12, 144.86, 164.55, 177.67, 190.23. MS (ESI): $[\mathrm{M}+1]^{+}=472.8$. Anal. calcd for $\mathrm{C}_{25} \mathrm{H}_{17} \mathrm{ClF}_{3} \mathrm{NOS}: \mathrm{C}, 63.63 ; \mathrm{H}, 3.63$; N, 2.97; found: C, 63.48; H, 3.51; N, 2.78.

### 5.1.3.7. [2-Amino-4-(4-methoxybenzyl)-5-phenyl-3-thienyl](4-chlorophenyl)methanone

(4g).
Following the general procedure B , the residue was purified by column chromatography, eluting with EtOAc-petroleum ether 1.5-8.5, to furnish the desired product $\mathbf{~} \mathbf{g}$ as a yellow solid. Yield $78 \%$,
mp 130-131 ${ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta: 3.56(\mathrm{~s}, 2 \mathrm{H}), 3.65(\mathrm{~s}, 3 \mathrm{H}), 6.26(\mathrm{bs}, 2 \mathrm{H}), 6.32(\mathrm{~d}, \mathrm{~J}=8.4 \mathrm{~Hz}$, $2 H), 6.52(\mathrm{~d}, \mathrm{~J}=8.4 \mathrm{~Hz}, 2 \mathrm{H}), 7.29(\mathrm{~m}, 9 \mathrm{H}) . \mathrm{MS}$ (ESI): $[\mathrm{M}+1]^{+}=434.9$. Anal. calcd for $\mathrm{C}_{25} \mathrm{H}_{20} \mathrm{ClNO}_{2} \mathrm{~S}: \mathrm{C}, 69.19 ; \mathrm{H}, 4.64 ; \mathrm{N}, 3.23$; found: C, 69.02; H, 4.48; N, 3.12.
5.1.3.8. \{2-Amino-5-phenyl-4-[4-(trifluoromethoxy)benzyl]-3-thienyl\}(4-chlorophenyl)methanone (4h). Following the general procedure B, the residue was purified by column chromatography, eluting with EtOAc-petroleum ether 1.5-8.5, to furnish the desired product $\mathbf{4 h}$ as a yellow oil. Yield $84 \%{ }^{1}{ }^{1} \mathrm{H}$ NMR $\left(d_{6}\right.$-DMSO) $\delta: 3.68(\mathrm{~s}, 2 \mathrm{H}), 6.58(\mathrm{~d}, \mathrm{~J}=8.8 \mathrm{~Hz}, 2 \mathrm{H}), 7.01(\mathrm{~d}, \mathrm{~J}=8.8 \mathrm{~Hz}, 2 \mathrm{H}), 7.26(\mathrm{~m}$, $2 \mathrm{H}), 7.34(\mathrm{~m}, 4 \mathrm{H}), 7.69(\mathrm{bs}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}-\mathrm{NMR}\left(d_{6}\right.$-DMSO) $\delta: 33.55,114.52,121.04$ (2C), 121.70, $127.95,128.44$ (2C), 129.30 (2C), 129.56 (2C), 129.63 (2C), 130.13 (2C), 131.36, 133.92, 135.99, 139.51, 139.66, 146.78, 164.90, 190.60. MS (ESI): $[\mathrm{M}+1]^{+}=488.8$. Anal. calcd for $\mathrm{C}_{25} \mathrm{H}_{17} \mathrm{ClF}_{3} \mathrm{NO}_{2} \mathrm{~S}: \mathrm{C}, 61.54 ; \mathrm{H}, 3.51 ; \mathrm{N}, 2.87$; found: C, $61.38 ; \mathrm{H}, 3.36 ; \mathrm{N}, 2.72$.

### 5.1.3.9. [2-Amino-4-(4-methylthiobenzyl)-5-phenyl-3-thienyl](4-chlorophenyl)methanone

Following the general procedure B , the residue was purified by column chromatography, eluting with EtOAc-petroleum ether 2-8, to furnish the desired product $4 \mathbf{i}$ as a yellow solid. Yield $63 \%, \mathrm{mp}$ $58-60{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR ( $d_{6}$-DMSO) $\delta: 2.37(\mathrm{~s}, 3 \mathrm{H}), 3.62(\mathrm{~s}, 2 \mathrm{H}), 6.43(\mathrm{~d}, \mathrm{~J}=8.0 \mathrm{~Hz}, 2 \mathrm{H}), 6.96(\mathrm{~d}, \mathrm{~J}=8.0$ $\mathrm{Hz}, 2 \mathrm{H}), 7.31(\mathrm{~d}, \mathrm{~J}=8.8 \mathrm{~Hz}, 2 \mathrm{H}), 7.39(\mathrm{~m}, 7 \mathrm{H}), 7.65(\mathrm{bs}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, d_{6}$-DMSO) $\delta$ : $14.83,32.91,114.16,120.82,125.78$ (2C), 127.29 (2C), 127.94 (2C), 128.72 (2C), 129.00 (2C), 129.78 (2C), 131.32, 133.49 (2C), 134.91, 135.47, 136.39, 139.02, 164.11, 190.08. MS (ESI): $[\mathrm{M}+1]^{+}=451.1$. Anal. calcd for $\mathrm{C}_{25} \mathrm{H}_{20} \mathrm{ClNOS}_{2}$ : C, $66.72 ; \mathrm{H}, 4.48$; $\mathrm{N}, 3.11$; found: C, 66.58; $\mathrm{H}, 4.32$; N, 2.96.
5.1.3.10. [2-Amino-4-(4-ethoxybenzyl)-5-phenyl-3-thienyl](4-chlorophenyl)methanone

Following the general procedure B, the residue was purified by column chromatography, eluting with EtOAc-petroleum ether 1.5-8.5, to furnish the desired product $\mathbf{4} \mathbf{j}$ as a yellow solid. Yield $95 \%$, mp $150-152{ }^{\circ} \mathrm{C} .{ }^{\mathrm{H}} \mathrm{H}$ NMR ( $d_{6}$-DMSO) $\delta: 1.24(\mathrm{t}, \mathrm{J}=6.8 \mathrm{~Hz}, 3 \mathrm{H}), 3.58(\mathrm{~s}, 2 \mathrm{H}), 3.87(\mathrm{q}, \mathrm{J}=6.8 \mathrm{~Hz}$, 2H), 6.35 (d, J=8.8 Hz, 2H), 6.59 (d, J=8.8 Hz, 2H), 7.29 (d, J=8.4 Hz, 2H), 7.44 (m, 7H), 7.64 (bs,
$2 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, d_{6}$-DMSO) $\delta: 14.52,32.57,62.66,113.78$ (2C), 114.21, 120.55, 127.23, 127.88 (2C), 128.28 (2C), 128.69 (2C), 129.03 (2C), 129.74 (2C), 131.23, 131.92, 133.58, 135.39, 139.10, 156.42, 164.05, 190.16. MS (ESI): $[\mathrm{M}+1]^{+}=449.0$. Anal. calcd for $\mathrm{C}_{26} \mathrm{H}_{22} \mathrm{ClNO}_{2} \mathrm{~S}: \mathrm{C}$, 69.71; H, 4.95; N, 3.13; found: C, 69.56; H, 4.69; N, 2.92.
5.1.3.11. [2-Amino-4-(4-isopropoxybenzyl)-5-phenyl-3-thienyl](4-chlorophenyl)methanone (4k). Following the general procedure B , the residue was purified by column chromatography, eluting with EtOAc-petroleum ether 2-8, to yield the desired product $\mathbf{4 k}$ as a yellow solid. Yield $70 \%$, mp $70-72{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta: 1.27(\mathrm{~d}, \mathrm{~J}=6.2 \mathrm{~Hz}, 6 \mathrm{H}), 3.63(\mathrm{~s}, 2 \mathrm{H}), 4.23(\mathrm{~m}, 1 \mathrm{H}), 6.36(\mathrm{bs}, 2 \mathrm{H})$, 6.41 (d, J=8.2 Hz, 2H), 6.58 (d, J=8.2 Hz, 2H), 7.34 (m, 7H), 7.42 (m, 2H). MS (ESI): $[\mathrm{M}+1]^{+}=462.5$. Anal. calcd for $\mathrm{C}_{27} \mathrm{H}_{24} \mathrm{ClNO}_{2} \mathrm{~S}: \mathrm{C}, 70.19 ; \mathrm{H}, 5.24 ; \mathrm{N}, 3.03$; found: C, 69.93; $\mathrm{H}, 5.06$; N, 2.89.
5.1.3.12. [2-Amino-4-(3-methoxybenzyl)-5-phenyl-3-thienyl](4-chlorophenyl)methanone

Following the general procedure B , the residue was purified by column chromatography, eluting with EtOAc-petroleum ether 2-8, to furnish the desired product $\mathbf{4 I}$ as a yellow solid. Yield $81 \%, \mathrm{mp}$ $58-60{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(d_{6}\right.$-DMSO) $\delta: 3.57(\mathrm{~s}, 3 \mathrm{H}), 3.64(\mathrm{~s}, 2 \mathrm{H}), 5.97(\mathrm{~d}, \mathrm{~J}=2.0 \mathrm{~Hz}, 1 \mathrm{H}), 6.11(\mathrm{~d}, \mathrm{~J}=7.6$ $\mathrm{Hz}, 1 \mathrm{H}), 6.59(\mathrm{~d}, \mathrm{~J}=8.0$ and $2.0 \mathrm{~Hz}, 1 \mathrm{H}), 6.98(\mathrm{t}, \mathrm{J}=8.0 \mathrm{~Hz}, 1 \mathrm{H}), 7.28(\mathrm{~m}, 3 \mathrm{H}), 7.37(\mathrm{~m}, 6 \mathrm{H}), 7.71$ (bs, 2H) $){ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, d_{6}$-DMSO) $\delta: 33.48,54.52,111.15,112.88,114.13,119.53,120.75$, 127.29, 127.88 (2C), 128.72 (2C), 128.84, 129.05 (2C), 129.68 (2C), 131.23, 133.55, 135.31, 139.14, 141.21, 158.79, 164.30, 190.15. MS (ESI): $[\mathrm{M}+1]^{+}=434.7$. Anal. calcd for $\mathrm{C}_{25} \mathrm{H}_{20} \mathrm{ClNO}_{2} \mathrm{~S}$ : C, 69.19; H, 4.64; N, 3.23; found: C, 68.98; H, 4.43; N, 3.09.

### 5.1.3.13. [2-Amino-4-(2-methoxybenzyl)-5-phenyl-3-thienyl](4-chlorophenyl)methanone (4m).

 Following the general procedure B , the residue was purified by column chromatography, eluting with EtOAc-petroleum ether 1-9, to furnish the desired product $\mathbf{4 m}$ as a yellow solid. Yield $85 \%$, $\mathrm{mp} 76-78{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR ( $d_{6}$-DMSO) $\delta: 3.47(\mathrm{~s}, 3 \mathrm{H}), 3.49(\mathrm{~s}, 2 \mathrm{H}), 6.55(\mathrm{~d}, \mathrm{~J}=7.6$ and $1.6 \mathrm{~Hz}, 1 \mathrm{H})$, $6.65(\mathrm{~d}, \mathrm{~J}=8.4 \mathrm{~Hz}, 1 \mathrm{H}), 6.73(\mathrm{t}, \mathrm{J}=8.4 \mathrm{~Hz}, 1 \mathrm{H}), 7.06(\mathrm{~m}, 3 \mathrm{H}), 7.25(\mathrm{~m}, 5 \mathrm{H}), 7.31(\mathrm{~m}, 2 \mathrm{H}), 7.96(\mathrm{bs}$,$2 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, d_{6}$-DMSO) $\delta: 27.39,54.46,109.26,113.95,119.65,120.53,126.86$, $127.21,127.50(2 \mathrm{C}), 127.76(2 \mathrm{C}), 128.64$ (2C), 128.72, 128.80 (2C), 130.68 (2C), 133.59, 134.47, 139.45, 156.13, 165.18, 190.64. MS (ESI): $[\mathrm{M}+1]^{+}=434.8$. Anal. calcd for $\mathrm{C}_{25} \mathrm{H}_{20} \mathrm{ClNO}_{2} \mathrm{~S}: \mathrm{C}$, 69.19; H, 4.64; N, 3.23; found: C, 68.93; H, 4.50; N, 3.02.
5.1.3.14. [2-Amino-4-(4-methoxy-3-methylbenzyl)-5-phenyl-3-thienyl](4-chlorophenyl)methanone (4n). Following the general procedure B, the residue was purified by column chromatography. eluting with EtOAc-petroleum ether 1.5-8.5, to furnish the desired product $\mathbf{4 n}$ as a yellow solid. Yield $90 \%$, mp $78-80{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left.\left(\mathrm{CDCl}_{3}\right)\right)$ 8: $2.01(\mathrm{~s}, 3 \mathrm{H}), 3.62(\mathrm{~s}, 2 \mathrm{H}), 3.81(\mathrm{~s}, 3 \mathrm{H}), 6.38(\mathrm{~m}$, $4 H), 6.61(\mathrm{~d}, \mathrm{~J}=8.6 \mathrm{~Hz}, 2 \mathrm{H}), 7.31(\mathrm{~m}, 8 \mathrm{H}) . \operatorname{MS}(\mathrm{ESI}):[\mathrm{M}+1]^{+}=449.1$. Anal. calcd for $\mathrm{C}_{26} \mathrm{H}_{22} \mathrm{ClNO}_{2} \mathrm{~S}: \mathrm{C}, 69.71 ; \mathrm{H}, 4.95$; N, 3.13; found: C, 69.56; H, 4.78; N, 3.02.
5.1.3.15. [2-Amino-4-(3,5-dimethyl-4-methoxybenzyl)-5-phenyl-3-thienyl](4-chlorophenyl) methanone (4o). Following the general procedure B, the crude residue was purified by column chromatography, eluting with EtOAc-petroleum ether, to furnish the desired product $\mathbf{4 0}$ as a yellow solid. Yield $95 \%, \mathrm{mp} 69-71{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta: 2.09(\mathrm{~s}, 6 \mathrm{H}), 3.62(\mathrm{~s}, 3 \mathrm{H}), 3.64(\mathrm{~s}, 2 \mathrm{H}), 6.08$ (bs, 2H), 6.44 (s, 2H), 7.24 (d, J=8.8 Hz, 2H), 7.32 (d, J=8.8 Hz, 2H), 7.37 (m, 5H). MS (ESI): $[\mathrm{M}+1]^{+}=463.1$. Anal. calcd for $\mathrm{C}_{27} \mathrm{H}_{24} \mathrm{ClNO}_{2} \mathrm{~S}: \mathrm{C}, 70.19 ; \mathrm{H}, 5.24 ; \mathrm{N}, 3.03$; found: C, $70.03 ; \mathrm{H}, 5.08$; N, 2.89.
5.1.3.16. [2-Amino-4-(2,4-dimethoxybenzyl)-5-phenyl-3-thienyl](4-chlorophenyl)methanone (4p). Following the general procedure B, the crude residue was purified by column chromatography, eluting with EtOAc-petroleum ether 2-8, to furnish the desired product $\mathbf{4 p}$ as a yellow solid. Yield $89 \%, \mathrm{mp} 169-171{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H} \operatorname{NMR}\left(\mathrm{CDCl}_{3}\right) \delta: 3.45(\mathrm{~s}, 3 \mathrm{H}), 3.50(\mathrm{~s}, 2 \mathrm{H}), 3.75(\mathrm{~s}, 3 \mathrm{H}), 6.14(\mathrm{~s}, 1 \mathrm{H})$, $6.34(\mathrm{dd}, \mathrm{J}=7.4$ and $1.2 \mathrm{~Hz}, 1 \mathrm{H}), 6.63(\mathrm{~m}, 3 \mathrm{H}), 7.11(\mathrm{~d}, \mathrm{~J}=8.8 \mathrm{~Hz}, 2 \mathrm{H}), 7.17(\mathrm{~d}, \mathrm{~J}=8.8 \mathrm{~Hz}, 2 \mathrm{H}), 7.33$ $(\mathrm{m}, 5 \mathrm{H}) . \mathrm{MS}(\mathrm{ESI}):[\mathrm{M}+1]^{+}=465.1$. Anal. calcd for $\mathrm{C}_{26} \mathrm{H}_{22} \mathrm{ClNO}_{3} \mathrm{~S}: \mathrm{C}, 67.30 ; \mathrm{H}, 4.78 ; \mathrm{N}, 3.02$; found: C, 67.11; H, 4.59; N, 2.89.
5.1.3.17. [2-Amino-5-phenyl-4-(3,4,5-trimethoxybenzyl)-3-thienyl](4-chlorophenyl)methanone (4q). Following the general procedure B , the crude residue was purified by column chromatography, eluting with EtOAc-petroleum ether 3-7, to yield the desired product $\mathbf{4 q}$ as a yellow solid. Yield $89 \%, \mathrm{mp} 181-183{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H} \operatorname{NMR}\left(\mathrm{CDCl}_{3}\right) \delta: 3.64(\mathrm{~s}, 6 \mathrm{H}), 3.67(\mathrm{~s}, 2 \mathrm{H}), 3.76(\mathrm{~s}, 3 \mathrm{H}), 5.70(\mathrm{~s}, 2 \mathrm{H})$, $6.41(\mathrm{bs}, 2 \mathrm{H}), 7.28(\mathrm{~m}, 4 \mathrm{H}), 7.37(\mathrm{~m}, 5 \mathrm{H}) . \operatorname{MS}(\mathrm{ESI}):[\mathrm{M}+1]^{+}=495.2$. Anal. calcd for $\mathrm{C}_{27} \mathrm{H}_{24} \mathrm{ClNO}_{4} \mathrm{~S}: \mathrm{C}, 65.65 ; \mathrm{H}, 4.90 ; \mathrm{N}, 2.84$; found: C, 65.49; H, 4.78; N, 2.68.

### 5.1.3.18. [2-Amino-4-benzyl-5-(4-fluorophenyl)-3-thienyl](4-chlorophenyl)methanone (4r).

 Following the general procedure B , the crude residue was purified by column chromatography, eluting with EtOAc-petroleum ether 2-8, to furnish the desired product $4 \mathbf{r}$ as a yellow solid. Yield $93 \%, \mathrm{mp} 58-60^{\circ} \mathrm{C} .{ }^{1} \mathrm{H} \operatorname{NMR}\left(\mathrm{CDCl}_{3}\right) \delta: 3.62(\mathrm{~s}, 2 \mathrm{H}), 6.35(\mathrm{bs}, 2 \mathrm{H}), 6.48(\mathrm{~d}, \mathrm{~J}=6.4 \mathrm{~Hz}, 2 \mathrm{H}), 7.00(\mathrm{~d}$, $\mathrm{J}=6.4 \mathrm{~Hz}, 2 \mathrm{H}), 7.04(\mathrm{~m}, 2 \mathrm{H}), 7.29(\mathrm{~m}, 7 \mathrm{H}) . \mathrm{MS}(\mathrm{ESI}):[\mathrm{M}+1]^{+}=422.9$. Anal. calcd for $\mathrm{C}_{24} \mathrm{H}_{17} \mathrm{ClFNOS}: \mathrm{C}, 68.32 ; \mathrm{H}, 4.06$; N, 3.32; found: C, 68.12; H, 3.89; N, 3.12.
### 5.1.3.19. [2-Amino-4-(4-fluorobenzyl)-5-(4-fluorophenyl)-3-thienyl](4-chlorophenyl)methanone

 (4s). Following the general procedure B, the crude residue was purified by column chromatography, eluting with EtOAc-petroleum ether 2-8, to furnish the desired product 4s as a yellow solid, yield $95 \%, \mathrm{mp} 141-143{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta: 3.61(\mathrm{~s}, 2 \mathrm{H}), 6.38(\mathrm{bs}, 2 \mathrm{H}), 6.42(\mathrm{~d}, \mathrm{~J}=8.8 \mathrm{~Hz}, 1 \mathrm{H}), 6.46$ (d, J=8.8 Hz, 1H), $7.46(\mathrm{~d}, \mathrm{~J}=8.8 \mathrm{~Hz}, 2 \mathrm{H}), 6.75(\mathrm{~d}, \mathrm{~J}=8.8 \mathrm{~Hz}, 2 \mathrm{H}), 6.99(\mathrm{~d}, \mathrm{~J}=8.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.06(\mathrm{~d}$, $\mathrm{J}=8.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.31(\mathrm{~m}, 4 \mathrm{H}) . \mathrm{MS}(\mathrm{ESI}):[\mathrm{M}+1]^{+}=440.9$. Anal. calcd for $\mathrm{C}_{24} \mathrm{H}_{16} \mathrm{ClF}_{2} \mathrm{NOS}: \mathrm{C}, 65.53$; H, 3.67; N, 3.18; found: C, 65.38; H, 3.48; N, 3.03.5.1.3.20. [2-Amino-4-(4-chlorobenzyl)-5-(4-fluorophenyl)-3-thienyl](4-chlorophenyl)methanone (4t). Following the general procedure B, the crude residue was purified by column chromatography, eluting with EtOAc-petroleum ether 2-8, to furnish the desired product $\mathbf{4 t}$ as a yellow solid. Yield $88 \%, \mathrm{mp} 72-74{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR ( $d_{6}$-DMSO) $\delta: 3.61(\mathrm{~s}, 2 \mathrm{H}), 6.51(\mathrm{~d}, \mathrm{~J}=8.4 \mathrm{~Hz}, 2 \mathrm{H}), 7.11(\mathrm{~d}, \mathrm{~J}=8.4 \mathrm{~Hz}$, $2 \mathrm{H}), 7.23(\mathrm{t}, \mathrm{J}=8.8 \mathrm{~Hz}, 2 \mathrm{H}), 7.30(\mathrm{~d}, \mathrm{~J}=8.4 \mathrm{~Hz}, 2 \mathrm{H}), 7.38(\mathrm{~m}, 4 \mathrm{H}), 7.68(\mathrm{bs}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}-\mathrm{NMR}\left(d_{6^{-}}\right.$ DMSO) $\delta: 32.87,113.90,115.56,115.78,119.88,127.78$ (2C), 127.97, 128.21 (2C), 129.12 (2C),
129.74 (2C), $130.18,131.09,131.17,135.53,138.55,138.93,160.14,162.57,164.18,189.63 . \mathrm{MS}$ (ESI): $[\mathrm{M}+1]^{+}=457.4$. Anal. calcd for $\mathrm{C}_{24} \mathrm{H}_{16} \mathrm{Cl}_{2} \mathrm{FNOS}: \mathrm{C}, 63.16 ; \mathrm{H}, 3.53 ; \mathrm{N}, 3.07$; found: $\mathrm{C}, 63.01$; H, 3.39; N, 2.88 .

### 5.1.3.21. 2-Amino-5-(4-fluorophenyl)-4-(4-methylbenzyl)-3-thienyl](4-chlorophenyl)methanone

 $(4 u)$. Following the general procedure B , the crude residue was purified by column chromatography, eluting with EtOAc-petroleum ether 2-8, to furnish the desired product $\mathbf{4 u}$ as a yellow solid. Yield $89 \%$, mp 71-73 ${ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR ( $d_{6}$-DMSO) $\delta: 2.16(\mathrm{~s}, 3 \mathrm{H}), 3.57(\mathrm{~s}, 2 \mathrm{H}), 6.37(\mathrm{~d}$, $\mathrm{J}=8.0 \mathrm{~Hz}, 2 \mathrm{H}), 6.85(\mathrm{~d}, \mathrm{~J}=8.0 \mathrm{~Hz}, 2 \mathrm{H}), 7.22(\mathrm{t}, \mathrm{J}=8.8 \mathrm{~Hz}, 2 \mathrm{H}), 7.30(\mathrm{~d}, \mathrm{~J}=8.4 \mathrm{~Hz}, 2 \mathrm{H}), 7.38(\mathrm{~m}, 4 \mathrm{H})$, 7.63 (bs, 2H). ${ }^{13} \mathrm{C}$-NMR ( $d_{6}$-DMSO) $\delta: 20.41,32.94,114.13,115.51,115.73,119.43,127.20$ (2C), 127.91 (2C), 128.45 (2C), 129.81, 129.91, 131.04, 131.12, 131.89, 134.51, 135.46, 136.41, 139.02, 160.07, 162.50, 163.96, 190.09. MS (ESI): $[\mathrm{M}+1]^{+}=436.9$. Anal. calcd for $\mathrm{C}_{25} \mathrm{H}_{19}$ ClFNOS: C, 68.88; H, 4.39; N, 3.21; found: C, 68.69; H, 4.27; N, 3.04.
### 5.1.3.22. [2-Amino-5-(4-fluorophenyl)-4-(4-methoxybenzyl)-3-thienyl](4-chlorophenyl)methanone

 (4v). Following the general procedure B , the crude residue was purified by column chromatography, eluting with EtOAc-petroleum ether 2-8, to furnish the desired product $\mathbf{4 v}$ as a yellow solid. Yield $91 \%, \operatorname{mp} 77-79{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR ( $d_{6}$-DMSO) $\delta: 3.52(\mathrm{~s}, 2 \mathrm{H}), 3.61(\mathrm{~s}, 3 \mathrm{H}), 6.35(\mathrm{~d}$, $\mathrm{J}=8.8 \mathrm{~Hz}, 2 \mathrm{H}), 6.59(\mathrm{~d}, \mathrm{~J}=8.8 \mathrm{~Hz}, 2 \mathrm{H}), 7.19(\mathrm{t}, \mathrm{J}=8.8 \mathrm{~Hz}, 2 \mathrm{H}), 7.28(\mathrm{~d}, \mathrm{~J}=8.6 \mathrm{~Hz}, 2 \mathrm{H}), 7.30(\mathrm{~m}, 4 \mathrm{H})$, $7.62(\mathrm{bs}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}$-NMR ( $d_{6}$-DMSO) $\delta: 32.59,54.88,113.40(2 \mathrm{C}), 114.14,115.60,115.82,119.43$, 127.99 (2C), 128.36 (2C), $129.85,130.04,131.17,131.25,131.35,132.25,135.51,139.16,157.28$, 160.17, 162.60, 164.12, 190.19. MS (ESI): $[\mathrm{M}+1]^{+}=452.9$. Anal. calcd for $\mathrm{C}_{25} \mathrm{H}_{19} \mathrm{ClFNO}_{2} \mathrm{~S}: \mathrm{C}$, 66.44; H, 4.24; N, 3.10; found: C, 66.26; H, 4.09; N, 2.95.5.1.3.23. [2-Amino-5-(4-fluorophenyl)-4-(4-methylthiolbenzyl)-3-thienyl](4-chlorophenyl) methanone (4w). Following the general procedure B, the crude residue was purified by column chromatography, eluting with EtOAc-petroleum ether 2-8, to furnish the desired product $\mathbf{4 w}$ as a yellow solid. Yield $88 \%$, mp $60-62{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta: 2.37(\mathrm{~s}, 3 \mathrm{H}), 3.58(\mathrm{~s}, 2 \mathrm{H}), 6.44(\mathrm{~d}$,
$\mathrm{J}=8.8 \mathrm{~Hz}, 2 \mathrm{H}), 6.96(\mathrm{~d}, \mathrm{~J}=8.8 \mathrm{~Hz}, 2 \mathrm{H}), 7.23(\mathrm{~m}, 2 \mathrm{H}), 7.31(\mathrm{~d}, \mathrm{~J}=8.4 \mathrm{~Hz}, 2 \mathrm{H}), 7.40(\mathrm{~m}, 4 \mathrm{H}), 7.64(\mathrm{bs}$, $2 \mathrm{H}) .{ }^{13} \mathrm{C}-\mathrm{NMR}\left(d_{6}\right.$-DMSO) $\delta: 14.84,32.86,114.07,115.54,115.75,119.62,125.81$ (2C), 127.94 (2C), 129.78 (2C), 131.07 (2C), 131.15 (2C), 131.60, 134.95, 135.50, 136.28, 138.98, 160.10, 162.54, 164.01, 190.05. ### 5.1.3.40. [2-Amino-5-(4-isopropoxybenzyl)-4-phenyl-3-thienyl](4-chlorophenyl)methanone (5h).

 Following the general procedure B , the crude residue was purified by column chromatography, eluting with EtOAc-petroleum ether 2-8, to furnish the desired product $\mathbf{5 h}$ as a colourless oil. Yield $70 \%{ }^{1}{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta: 1.28(\mathrm{~d}, \mathrm{~J}=6.2 \mathrm{~Hz}, 6 \mathrm{H}), 3.80(\mathrm{~s}, 2 \mathrm{H}), 4.52(\mathrm{~m}, 1 \mathrm{H}), 6.56(\mathrm{bs}, 2 \mathrm{H}), 6.77(\mathrm{~d}$, $\mathrm{J}=8.2 \mathrm{~Hz}, 2 \mathrm{H}), 6.82(\mathrm{~d}, \mathrm{~J}=8.2 \mathrm{~Hz}, 2 \mathrm{H}), 6.92(\mathrm{~m}, 2 \mathrm{H}), 6.98(\mathrm{~m}, 5 \mathrm{H}), 7.15(\mathrm{~d}, \mathrm{~J}=8.2 \mathrm{~Hz}, 2 \mathrm{H}) . \mathrm{MS}$ (ESI): $[\mathrm{M}+1]^{+}=463.4$. Anal. calcd for $\mathrm{C}_{27} \mathrm{H}_{24} \mathrm{ClNO}_{2} \mathrm{~S}: \mathrm{C}, 70.19 ; \mathrm{H}, 5.24 ; \mathrm{N}, 3.03$; found: C, 69.98; H, 5.10; N, 2.92.
### 5.1.3.41. [2-Amino-5-(4-methoxy-3-methylbenzyl)-4-phenyl-3-thienyl](4-chlorophenyl)methanone

 (5i). Following the general procedure B, the crude residue was purified by column chromatography, eluting with EtOAc-petroleum ether 2-8, to furnish the desired product as a yellow oil. Yield $61 \%$. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta: 2.17(\mathrm{~s}, 3 \mathrm{H}), 3.78(\mathrm{~s}, 2 \mathrm{H}), 3.81(\mathrm{~s}, 3 \mathrm{H}), 6.66(\mathrm{bs}, 2 \mathrm{H}), 6.74(\mathrm{~d}, \mathrm{~J}=8.6 \mathrm{~Hz}, 2 \mathrm{H})$, $6.88(\mathrm{~m}, 3 \mathrm{H}), 6.94(\mathrm{~m}, 5 \mathrm{H}), 7.02(\mathrm{~d}, \mathrm{~J}=8.6 \mathrm{~Hz}, 2 \mathrm{H}) . \mathrm{MS}(\mathrm{ESI}):[\mathrm{M}+1]^{+}=449.5$. Anal. calcd for $\mathrm{C}_{26} \mathrm{H}_{22} \mathrm{ClNO}_{2} \mathrm{~S}: \mathrm{C}, 69.71$; H, 4.95; N, 3.13; found: C, 69.58; H, 4.81; N, 2.98.5.1.4. Preparation of 2-[3-(4-chlorobenzoyl)-5-methyl-4-phenyl-2-thienyl]-1H-isoindole-1,3(2H)dione (9). To a solution of 2-methyl-4-phenyl-thiophene 8 (1.3 g., 4 mmol ) in acetic acid ( 25 mL ) was added phthalic anhydride ( $0.74 \mathrm{~g} ., 5 \mathrm{mmol}$.) and the resulting mixture heated under reflux for 4 h. The solvent was evaporated in vacuo and the residue dissolved in methylene chloride ( 20 mL ). The organic solution was washed with a saturated aqueous solution of $\mathrm{NaHCO}_{3}(5 \mathrm{~mL})$, water ( 5 $\mathrm{mL})$, brine ( 5 mL ), dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, and concentrated in vacuo. The crude residue was stirred for 1 h with petroleum ether ( 20 mL ), and after filtration furnished the product 9 as a yellow powder.

Yield: $83 \%$, mp 184-186 ${ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right)$ : $2.45(\mathrm{~s}, 3 \mathrm{H}), 7.09(\mathrm{~d}, \mathrm{~J}=7.2 \mathrm{~Hz}, 2 \mathrm{H}), 7.15(\mathrm{~m}$, $5 \mathrm{H}), 7.54(\mathrm{~d}, \mathrm{~J}=7.2 \mathrm{~Hz}, 2 \mathrm{H}), 7.74(\mathrm{~m}, 2 \mathrm{H}), .8 .50(\mathrm{~m}, 2 \mathrm{H}) . \mathrm{MS}(\mathrm{ESI}):[\mathrm{M}]^{+}=458.0$.

### 5.1.5. Preparation of 2-[5-(bromomethyl)-3-(4-chlorobenzoyl)-4-phenyl-2-thienyl]-1H-isoindole-

 1,3(2H)-dione (10). To a refluxing suspension of $9(2.3 \mathrm{~g} ., 5 \mathrm{mmol})$ in $\mathrm{CCl}_{4}(50 \mathrm{~mL})$ was added a mixture of NBS ( $1.9 \mathrm{~g} ., 10 \mathrm{mmol}$.) and $75 \%$ benzoyl peroxide ( $140 \mathrm{mg}, 0.6 \mathrm{mmol}$ ). After one hour at reflux, the yellow solution was cooled to room temperature, the succinimide that separated upon cooling was filtered, and the filter cake was rinsed with $\mathrm{CCl}_{4}(10 \mathrm{~mL})$. The filtrate was washed with a saturated aqueous solution of $\mathrm{NaHCO}_{3}(10 \mathrm{~mL})$, water $(10 \mathrm{~mL})$, brine $(10 \mathrm{~mL})$, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, and concentrated under reduced pressure to give a yellow oil. The crude residue, purified by column chromatography on silica gel eluting with a mixture of EtOAc-petroleum ether 2-8, furnished compound 10 as a yellow solid. Yield: $52 \%$, mp $223-225{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H} \operatorname{NMR}\left(\mathrm{CDCl}_{3}\right) \delta: 4.63(\mathrm{~s}, 2 \mathrm{H})$, $7.11(\mathrm{~d}, \mathrm{~J}=8.4 \mathrm{~Hz}, 2 \mathrm{H}), 7.23(\mathrm{~m}, 5 \mathrm{H}), 7.56(\mathrm{~d}, \mathrm{~J}=8.4 \mathrm{~Hz}, 2 \mathrm{H}), 7.78(\mathrm{~m}, 2 \mathrm{H}), 7.87(\mathrm{~m}, 2 \mathrm{H}) . \mathrm{MS}$ (ESI): $[\mathrm{M}]^{+}=536.8,538.9$.
### 5.2. Biology Experiments

### 5.2.1. Materials.

$\left[{ }^{3} \mathrm{H}\right]$ DPCPX $\left(\left[{ }^{3} \mathrm{H}\right] 1\right.$,3-dipropyl-8-cyclopentyl-xanthine; specific activity, $\left.120 \mathrm{Ci} / \mathrm{mmol}\right),\left[{ }^{3} \mathrm{H}\right] \mathrm{CCPA}$ ( $\left[{ }^{3} \mathrm{H}\right] 2$-chloro- $\mathrm{N}^{6}$-cyclopentyladenosine; specific activity, $55 \mathrm{Ci} / \mathrm{mmol}$ ), and $\left[{ }^{3} \mathrm{H}\right] \mathrm{NECA}\left(\left[{ }^{3} \mathrm{H}\right] 55^{\prime}-\mathrm{N}\right.$ ethylcarboxamidoadenosine; specific activity, $29.4 \mathrm{Ci} / \mathrm{mmol}$ ) were obtained from Perkin Elmer Research Products (Boston, MA); $\quad\left[{ }^{3} \mathrm{H}\right]$ ZM $241385 \quad\left(\left[{ }^{3} \mathrm{H}\right](4-(2-[7-\mathrm{amino}-2-(2-\right.$ furil)[1,2.4]triazolo[2,3-a][1,3,5]triazin-5-ylamino]ethyl)phenol); specific activity, $17 \mathrm{Ci} / \mathrm{mmol}$ ) was obtained from Biotrend (Cologne, Germany); $\quad\left[{ }^{3} \mathrm{H}\right]$ MRE-3008-F20 $\quad\left(\left[{ }^{3} \mathrm{H}\right] 5-\mathrm{N}-(4-\right.$ methoxyphenylcarbamoyl)amino-8-propyl-2-(2-furyl)pyrazolo[4,3-e]-1,2,4-triazolo c]pyrimidine; specific activity, $67 \mathrm{Ci} / \mathrm{mmol}$ ) was obtained from GE Healthcare (Buckinghamshire, UK). DPCPX (1,3-dipropyl-8-cyclopentyl-xanthine), R-PIA ((R)- $\mathrm{N}^{6}$-(L-2Phenylisopropyl)adenosine) and CCPA ( 2 -chloro- $\mathrm{N}^{6}$-cyclopentyladenosine) were obtained from

Sigma (St. Louis, MO, USA). $\mathrm{hA}_{1}, \mathrm{hA}_{2 \mathrm{~A}}$ and $\mathrm{hA}_{3} \mathrm{CHO}$ cells were obtained from Perkin Elmer Research Products (Boston, MA). All other reagents were of analytical grade and obtained from commercial sources.

### 5.2.2. Cell membrane preparation.

For the $\left[{ }^{3} \mathrm{H}\right]$ CCPA saturation, and the $\left[{ }^{3} \mathrm{H}\right]$ DPCPX, $\left[{ }^{3} \mathrm{H}\right]$ ZM 241385, and $\left[{ }^{3} \mathrm{H}\right]$ MRE-3008-F20 competition binding experiments the $\mathrm{hA}_{1} \mathrm{CHO}, \mathrm{hA}_{2 \mathrm{~A}} \mathrm{CHO}$ and $\mathrm{hA}_{3} \mathrm{CHO}$ cells were grown adherently and maintained in Dulbecco's modified Eagle's medium with nutrient mixture F12, containing $10 \%$ fetal calf serum, penicillin ( $100 \mathrm{U} / \mathrm{mL}$ ), streptomycin ( $100 \mu \mathrm{~g} / \mathrm{mL}$ ), L-glutamine (2 mM ), geneticine (G418) $0.2 \mathrm{mg} / \mathrm{mL}$ at $37{ }^{\circ} \mathrm{C}$ in $5 \% \mathrm{CO}_{2} / 95 \%$ air. For membrane preparation the culture medium was removed and the cells were washed with phosphate-buffered saline and scraped off T75 flasks in ice-cold hypotonic buffer ( 5 mM Tris HCl, 1 mM EDTA, pH 7.4 ). The cell suspension was homogenized with a Polytron, the homogenate was spun for 10 min at 1000 x g and the supernatant was then centrifuged for 30 min at $100,000 \mathrm{xg}$. The membrane pellet was suspended in 50 mM Tris HCl buffer ( pH 7.4 ) for $\mathrm{A}_{1} \mathrm{ARs}$, in 50 mM Tris $\mathrm{HCl}, 10 \mathrm{mM} \mathrm{MgCl}$ ( pH 7.4) for $\mathrm{A}_{2 \mathrm{~A}} \mathrm{ARs}$, in 50 mM Tris $\mathrm{HCl}, 10 \mathrm{mM} \mathrm{MgCl} 2,1 \mathrm{mM}$ EDTA ( pH 7.4 ) for $\mathrm{A}_{3} A R s$. The membranes were incubated with $2-3 \mathrm{IU} / \mathrm{mL}$ of adenosine deaminase to reduce the endogenous adenosine. The protein concentration was determined according to a Bio-Rad method with bovine albumin as a standard reference [26]. For the $\left[{ }^{3} \mathrm{H}\right] \mathrm{NECA}$ kinetic binding experiments, $\mathrm{hA}_{1} \mathrm{CHO}$ cells were grown in Ham's F12 medium, containing $10 \%$ (v/v) normal adult bovine serum, streptomycin $(100 \mu \mathrm{~g} / \mathrm{mL})$, penicillin ( $100 \mathrm{IU} / \mathrm{mL}$ ), and G418 $(0.4 \mathrm{mg} / \mathrm{mL})$, at $37{ }^{\circ} \mathrm{C}$ in $5 \% \mathrm{CO}_{2}$. Cells were detached from $10-\mathrm{cm} \varnothing$ culture plates by scraping them into 5 mL phosphate-buffered saline (PBS), collected, and centrifuged at $700 \mathrm{~g}(3000 \mathrm{rpm})$ for 5 min . Cell pellets were pooled and resuspended in 50 mM Tris- HCl buffer ( pH 7.4 ), supplemented with $5 \mathrm{mM} \mathrm{MgCl}_{2}$. An UltraThurrax (Heidolph Instruments, Schwabach, Germany) was used to homogenize the cell suspension. Membranes and the cytosolic fraction were separated by centrifugation at $100,000 \mathrm{~g}$ (31,000 rpm) in a Beckman Optima LE-80K ultracentrifuge (Beckman Coulter, Fullerton, CA), at 4
${ }^{\circ} \mathrm{C}$ for 20 min . The pellet was resuspended in 50 mM Tris- $\mathrm{HCl}, 5 \mathrm{mM} \mathrm{MgCl}{ }_{2}$ buffer, and the homogenization and centrifugation step was repeated. The same Tris- HCl buffer was used to resuspend the pellet, and ADA was added ( $0.8 \mathrm{IU} / \mathrm{mL}$ ). Membranes were stored in $250 \mu \mathrm{~L}$ aliquots at $-80^{\circ} \mathrm{C}$. Concentrations of the membrane protein were measured using a Pierce BCA protein assay kit [26].

### 5.2.3. Binding Experiments in $h A_{l} \mathrm{CHO}$ membranes

### 5.2.3.1. [ $\left.{ }^{3} H\right] C C P A$ Binding Experiments.

Saturation binding experiments of $\left[{ }^{3} \mathrm{H}\right] \mathrm{CCPA}(0.05$ to 20 nM$)$ to $\mathrm{hA}_{1} \mathrm{CHO}$ membranes were performed in triplicate at $25^{\circ} \mathrm{C}$ for 90 min in 50 mM Tris- $\mathrm{HCl}, \mathrm{pH} 7.4$, in the absence and presence of the tested compounds at the final concentration of $10 \mu \mathrm{M}$ [27]. Non-specific binding was defined as binding in the presence of $1 \mu \mathrm{M}$ R-PIA.

### 5.2.3.2. $\left.{ }^{3} H\right] D P C P X$ Competition Binding Experiments.

Competition binding experiments of $1 \mathrm{nM}\left[{ }^{3} \mathrm{H}\right] \mathrm{DPCPX}$ were performed in triplicate in 50 mM Tris$\mathrm{HCl}, \mathrm{pH} 7.4$, for 90 min at $25^{\circ} \mathrm{C}$. The effect of the different tested compounds at a concentration of $10 \mu \mathrm{M}$ on the CCPA curve ( $0.01 \mathrm{nM}-1 \mu \mathrm{M}$ ) was investigated [28]. Non-specific binding was defined as binding in the presence of $1 \mu \mathrm{M}$ DPCPX.

### 5.2.3.3. Assay of the Antagonist Activity versus $A_{1}, A_{2 A}$ and $A_{3}$ ARs.

$\mathrm{A}_{1}, \mathrm{~A}_{2 \mathrm{~A}}$, and $\mathrm{A}_{3} \mathrm{AR}$ competition binding experiments were performed using $1 \mathrm{nM}\left[{ }^{3} \mathrm{H}\right] \mathrm{DPCPX}, 1$ $\mathrm{nM}\left[{ }^{3} \mathrm{H}\right]$ ZM 241385, and $2 \mathrm{nM}\left[{ }^{3} \mathrm{H}\right]$ MRE-3008-F20 as radioligands, respectively [28-30]. Membrane suspensions were incubated in 50 mM Tris $\mathrm{HCl}, \mathrm{pH} 7.4$, at $25^{\circ} \mathrm{C}$ for 120 min , in 50 mM Tris $\mathrm{HCl}, 10 \mathrm{mM} \mathrm{MgCl} 2, \mathrm{pH} 7.4$, at $4^{\circ} \mathrm{C}$ for 60 min , or in 50 mM Tris $\mathrm{HCl}, 10 \mathrm{mM} \mathrm{MgCl}, 1 \mathrm{mM}$ EDTA, pH 7.4 at $4^{\circ} \mathrm{C}$ for 120 min to study $\mathrm{A}_{1}, \mathrm{~A}_{2 \mathrm{~A}}$, and $\mathrm{A}_{3}$ ARs, respectively. Non-specific binding was defined as the binding in the presence of $1 \mu \mathrm{M}$ DPCPX or ZM 241385 or MRE-3008-F20 for $A_{1}, A_{2 A}$, and $A_{3} A R s$, respectively. Inhibition was expressed as percentage of control specific
binding (100\%). Test agents were dissolved in DMSO and added to the assay from a 100 -fold concentrated solution in DMSO. Control incubations also contained 1\% DMSO.

Bound and free radioactivity were separated by filtering the assay mixture through Whatman GF/B glass fiber filters using a Brandel cell harvester (Brandel Instruments, Unterföhring, Germany). The filter bound radioactivity was counted by Packard Tri Carb 2810 TR scintillation counter (Perkin Elmer).

### 5.2.4. Effect of the novel compounds in cyclic AMP assays.

Human $\mathrm{A}_{1} \mathrm{CHO}$ cells ( $10^{6}$ cells $/ \mathrm{mL}$ ) were prepared as described above and were suspended in 0.5 mL incubation mixture phosphate buffer, containing 1.0 IU adenosine deaminase $/ \mathrm{mL}$ and 0.5 mM 4-(3-butoxy-4-methoxybenzyl)-2-imidazolidinone (Ro 20-1724) as a phosphodiesterase inhibitor and preincubated for 10 min in a shaking bath at $37^{\circ} \mathrm{C}$. The allosteric enhancers were studied at 10 $\mu \mathrm{M}$ concentration that was added to the mixture for a further 10 min . The effect of the allosteric enhancers $(100 \mathrm{nM})$ was also studied in the presence of a low concentration of CCPA $(1 \mathrm{pM})$. Forskolin $1 \mu \mathrm{M}$ was added for 5 min and was used to stimulate the activity of adenylate cyclase. The reaction was terminated by the addition of cold $6 \%$ trichloroacetic acid (TCA). The TCA suspension was centrifuged at $2,000 \mathrm{~g}$ for 10 min at $4^{\circ} \mathrm{C}$ and the supernatant was extracted four times with water saturated diethyl ether. The final aqueous solution was tested for cAMP levels by a competition protein binding assay. Samples of cAMP standards ( $0-10 \mathrm{pmol}$ ) were added to each test tube containing trizma base 0.1 M , aminophylline 8.0 mM , mercaptoethanol $6.0 \mathrm{mM}, \mathrm{pH} 7.4$, and $\left[{ }^{3} \mathrm{H}\right]$-cAMP (at the final concentration of 1 nM ). The binding protein, previously prepared from beef adrenals, was added to the samples and incubated at $4{ }^{\circ} \mathrm{C}$ for 150 min . At the end of the incubation time and after the addition of charcoal, the samples were centrifuged at $2,000 \mathrm{~g}$ for 10 min . The clear supernatant was mixed with 4 mL of Ultima Gold (Perkin Elmer) and counted in a Packard Tri Carb 2810 TR scintillation counter (Perkin Elmer).

### 5.2.5. Kinetic radioligand binding experiments.

Association and dissociation experiments were performed at $37{ }^{\circ} \mathrm{C}$ in a total volume of $100 \mu \mathrm{~L}$ assay buffer ( 50 mM Tris- $\mathrm{HCl}(\mathrm{pH} 7.4)$ supplemented with 5 mM MgCl$)_{2}$. Membrane aliquots containing $13 \mu \mathrm{~g}$ of protein were incubated with $7 \mathrm{nM}\left[{ }^{3} \mathrm{H}\right] \mathrm{NECA}$, in the presence or absence of 1 $\mu \mathrm{M}$ PD81,723 or $\mathbf{4 z}$. Total binding was less than $10 \%$ of the total radioactivity added, to prevent radioligand depletion. Non-specific binding was determined in the presence of $10 \mu \mathrm{M}$ DPCPX. In association experiments, the amount of radioligand bound to the receptor was measured at different time intervals during a total incubation time of 45 min . For dissociation experiments, the reaction mix was preincubated for 45 min , to allow full association of the radioligand to the receptor. After the preincubation, radioligand dissociation was initiated by the addition of $10 \mu \mathrm{M}$ unlabeled DPCPX. The amount of radioligand still bound to the receptor was measured at various time intervals for a total duration of 2 h .

Incubations were terminated by rapid vacuum filtration to separate bound from free radioligand through 96-well GF/B filter plates, using a Filtermate harvester (Perkin Elmer, Groningen, The Netherlands). Filters were subsequently washed ten times with ice-cold wash buffer ( 50 mM Tris$\mathrm{HCl}[\mathrm{pH} 7.4]$ supplemented with 5 mM MgCl 2 ). The filter-bound radioactivity was determined by scintillation spectrometry using a 1450 Microbeta Wallac Trilux scintillation counter (Perkin Elmer).

### 5.2.6. Formalin Assay.

Male CD1 mice (22-24 g) were obtained from Charles River (Milan, Italy). The animals were kept under standard environmental temperature and humidity-controlled conditions $\left(22 \pm 2^{\circ} \mathrm{C}\right)$ with 12 h light/dark cycle with food and water ad libitum. The animals were acclimated to the laboratory settings for at least 1 h before testing and were used only once throughout the experiments. All the procedures used in the present study were carried out in accordance with European Communities Council directives (86/609/EEC) and National Laws and Policies (D.L.116/92) with authorization from the Italian Ministry for Health (122/2011-B).

The formalin test measures nociception responses to an injection in the plantar surface of the hind paw of a formalin dilution ( $1.5 \%$ in saline, $20 \mu \mathrm{l}$ ). After the injection each mouse was immediately returned to a plexiglass observation chamber. The degree of pain intensity was assessed as the total time spent by the animal licking, biting, shaking, favouring, and flinching of the injected paw, measured by visual observation and a digital time-out stopwatch for 45 min [31]. Each mouse was randomly assigned to one of the experimental groups ( $\mathrm{n}=6$ ) and received intraperitoneal administration of vehicle or compound $\mathbf{4 z}(0.03,0.3$ or $3 \mathrm{mg} / \mathrm{kg}) 15 \mathrm{~min}$ before formalin injection.

### 5.2.7. Data Analysis.

Saturation and competition binding experiments were analysed with the program LIGAND, which performed a weighted, non-linear, least squares curve fitting program [32]. Inhibitory binding constants, Ki , were also calculated from the $\mathrm{IC}_{50}$ values according to the Cheng and Prusoff equation $\mathrm{Ki}=\mathrm{IC}_{50} /\left(1+\left[\mathrm{C}^{*}\right] / \mathrm{K}_{\mathrm{D}}{ }^{*}\right)$, where $\left[\mathrm{C}^{*}\right]$ is the concentration of the radioligand and $\mathrm{K}_{\mathrm{D}}{ }^{*}$ its dissociation constant [33]. Data from the kinetic radioligand binding experiments were analyzed using the non-linear regression curve fitting program Prism 5.1 (GraphPad, San Diego, CA, U.S.A.). Kinetic $\mathrm{k}_{\text {on }}$ and $\mathrm{k}_{\text {off }}$ values were obtained by analysis of the association and dissociation data. The association data was preferentially fit to a two-phase association curve for the control situation and in the presence of PD81,723, but fit better to a one-phase association curve in the presence of $\mathbf{4 z}$. The dissociation data fit best to a two-phase dissociation equation in all cases. However, for the purpose of clarity and unambiguous comparability between the situations, we chose to present all values from association and dissociation data fit to one-phase kinetics. The kinetic $\mathrm{K}_{\mathrm{D}}$ was calculated from the one-phase association and dissociation rates, by dividing the $\mathrm{k}_{\text {off }}$ by the $\mathrm{k}_{\mathrm{on}}$ values. All experimental data are expressed as mean $\pm$ standard error of the mean (S.E.M.) of three or four independent experiments performed in duplicate. For the kinetic radioligand binding and formalin test, statistical analysis of the data was performed using an unpaired 2-sided Student's t-test.

In our experiments, the reference compound PD 81,723 (at a concentration of $10 \mu \mathrm{M}$ ) did not inhibit $\left[{ }^{3} \mathrm{H}\right]$ DPCPX binding to human $\mathrm{A}_{1}$ receptors transfected in CHO cells. For the same reference compound, Bruns (Reference 16a) showed a $\mathrm{K}_{\mathrm{i}}$ value of $11 \mu \mathrm{M}$ obtained in competition binding experiments by using $\left[{ }^{3} \mathrm{H}\right]$ DPCPX as radioligand on rat membranes. Furthermore, data performed on CHO-K1cells stably expressing the human $\mathrm{A}_{1}$ receptors (reference 17f) reported an inhibition of $\left[{ }^{3} \mathrm{H}\right]$ DPCPX binding to human $\mathrm{A}_{1}$ receptors by PD 81,723 only of $42 \pm 7 \%$, when tested at $100 \mu \mathrm{M}$. We speculate that species differences in affinity binding of PD 81,723 may explain the discrepancy between the data.

## Figure, Chart and Scheme Captions

Figure 1. Histograms showing the cAMP inhibition, expressed in $\mathrm{pmol} / 10^{6}$ cells, mediated by novel allosteric enhancers $\mathbf{4 g}, \mathbf{4} \mathbf{j}$ and $\mathbf{4 z}$ at $10 \mu \mathrm{M}$ concentration (A). The effect of the examined compounds PD $81,723, \mathbf{4 g}, \mathbf{4} \mathbf{j}$ and $\mathbf{4 z}(100 \mathrm{nM})$ was also studied in the presence of 1 pM CCPA (B). Values are expressed as mean $\pm$ SEM of three separate experiments, as described in Experimental Section.

Figure 2. $\left[{ }^{3} \mathrm{H}\right]$-CCPA saturation binding curves at human $\mathrm{A}_{1}$ adenosine receptors (A). Under control conditions, $\mathrm{K}_{\mathrm{D}}$ value was $1.1 \pm 0.1 \mathrm{nM}$ and the Bmax was $521 \pm 47 \mathrm{fmol} / \mathrm{mg}$ protein. In the presence of novel enhancers $\mathbf{4 g}, \mathbf{4}$ and $\mathbf{4 z}(10 \mu \mathrm{M}), \mathrm{K}_{\mathrm{D}}$ values were similar to those obtained in controls and Bmax values were as reported in Table 2. Values are the means and vertical lines are the SEM of three separate experiments, as described in Experimental Section. Scatchard plots of the same experimental data (B).

Figure 3. Inhibition curves of specific $\left[{ }^{3} \mathrm{H}\right]$-DPCPX binding to human $\mathrm{A}_{1}$ ARs by CCPA in the absence and in the presence of novel enhancers $\mathbf{4 g}, \mathbf{4} \mathbf{j}$ and $\mathbf{4 z}(10 \mu \mathrm{M})$. Affinity values were calculated by using a one-state model of analysis. Values are the means and vertical lines are the SEM of three separate experiments as described in Experimental Section.

Figure 4. Association (A) and dissociation (B) of $\left[{ }^{3} \mathrm{H}\right]$ NECA ( 7 nM ), in the presence or absence of $1 \mu \mathrm{M}$ PD 81,423 or $\mathbf{4 z}$, at $37^{\circ} \mathrm{C}$ to $\mathrm{hA}_{1} \mathrm{AR}$ stably expressed on CHO membranes. In the association experiments, the amount of radioligand bound to the receptor was measured at each time point. Before dissociation, $\left[{ }^{3} \mathrm{H}\right]$ NECA was allowed to fully associate to $\mathrm{hA}_{1} \mathrm{AR}$ CHO membranes. After addition of $10 \mu \mathrm{M}$ DPCPX (final concentration), the amount of radioligand bound to the receptor was measured at each time point. The figure shows graphs from a representative experiment performed in duplicate.

Figure 5. Time response curve of nociceptive responses in the formalin test after intraperitoneal administration of vehicle or $\mathbf{4 z}$ at three different doses ( $0.03,0.3$ and $3.0 \mathrm{mg} / \mathrm{kg}$ ). Data are presented as mean $\pm \mathrm{SEM}$ relative to $\mathrm{n}=6$ mice/group.

Chart 1. Structures of previously described 2-amino-3-aroyl thiophene derivatives 1a-e, 2a and 3ab as allosteric modulators for the $\mathrm{A}_{1}$ adenosine receptor

Chart 2. Structures of 2-amino-3-(p-chlorobenzoyl)-4.5-disubstituted thiophene derivatives 4a-af, and 5a-i evaluated in this study as allosteric ligands for the $\mathrm{A}_{1}$ adenosine receptor

Scheme 1. Reagents. a: $\mathrm{ArB}(\mathrm{OH})_{2}, \mathrm{Pd}_{\left(\mathrm{Ph}_{3} \mathrm{P}\right)_{4}, \mathrm{~K}_{2} \mathrm{CO}_{3}, \mathrm{PhCH}_{3}, 100^{\circ} \mathrm{C} \text {; b: } \mathrm{NH}_{2} \mathrm{NH}_{2}, \mathrm{EtOH} \text {, reflux. }}^{\text {. }}$

Scheme 2. Reagents. a: phthalic anhydride, AcOH , reflux; b: NBS , benzoyl peroxide (cat.), $\mathrm{CCl}_{4}$, reflux; c: $\mathrm{ArB}(\mathrm{OH})_{2}, \mathrm{Pd}\left(\mathrm{Ph}_{3} \mathrm{P}\right)_{4}, \mathrm{~K}_{2} \mathrm{CO}_{3}$, toluene, reflux; d: $\mathrm{NH}_{2} \mathrm{NH}_{2}$, EtOH , reflux.

| $\mathbf{2 a}$ | $6008 \pm 512$ | $11.4 \pm 1.1$ | $1.8 \pm 0.1$ | $8.7 \pm 0.7$ |
| 3a | $3022 \pm 309$ | $5.8 \pm 0.6$ | $3.8 \pm 0.4$ | $4.0 \pm 0.4$ |
| 1a (PD 81,723) | $692 \pm 63$ | $1.3 \pm 0.1$ | $10.9 \pm 1.1$ | $1.4 \pm 0.1$ |

${ }^{a}$ The values are expressed as the mean $\pm$ SEM, $\mathrm{n}=3$ independent experiments.
$(A)=B \max$ (fmol/mg protein) and Bmax shift obtained in $\left[{ }^{3} \mathrm{H}\right]$ CCPA saturation binding experiments performed in the absence $(\mathrm{Bmax}=521 \pm 47 \mathrm{fmol} / \mathrm{mg}$ protein) or in the presence of $10 \mu \mathrm{M}$ enhancers.
$(B)=K i$ values of CCPA in the presence of $10 \mu \mathrm{M}$ test compounds and CCPA shift $=\mathrm{Ki}(\mathrm{CCPA}) / \mathrm{Ki}(\mathrm{CCPA}+10 \mu \mathrm{M}$ enhancers) where the Ki of CCPA was $15.1 \pm 1.4 \mathrm{nM}$.

Table 3. Association rate constants ( $\mathrm{k}_{\mathrm{on}}$ ), dissociation rate constants ( $\mathrm{k}_{\text {off }}$ ), and affinity $\left(\mathrm{K}_{\mathrm{D}}\right)$ values of $\left[{ }^{3} \mathrm{H}\right]$ NECA $(7 \mathrm{nM})$, in the presence or absence of $1 \mu \mathrm{M}$ PD81,423 or $\mathbf{4 z}$, derived from association and dissociation experiments at $37^{\circ} \mathrm{C}$ on $\mathrm{hA}_{1} \mathrm{AR}$ stably expressed on CHO membranes.

|  | $\mathbf{k}_{\text {on }}$ <br> $\left(n M^{-1} \cdot \min ^{-1}\right)$ | $\mathbf{k}_{\text {off }}$ <br> $\left(\mathrm{min}^{-1}\right)$ | $\mathbf{K}_{\mathbf{D}}$ <br> $(n M)$ |
| :---: | :---: | :---: | :---: |
| Control | $0.0222 \pm 0.0023$ | $0.0194 \pm 0.0009$ | $0.87 \pm 0.10$ |
| $+1 \mu \mathrm{M} \mathrm{PD} 81,723$ | $0.0251 \pm 0.0020$ | $0.0157 \pm 0.0012$ | $0.63 \pm 0.07$ |
| $+1 \mu \mathrm{M} \mathrm{4z}$ | $0.0204 \pm 0.0007$ | $0.0079 \pm 0.0005^{* * *}$ | $0.39 \pm 0.03^{* *}$ |

$K_{D}$ was calculated by $K_{D}=k_{\text {off }} / k_{\text {on }}$.
Significantly different from control with $* * \mathrm{p}<0.01$ or $* * * \mathrm{p}<0.001$ (unpaired Student's t -test).
Values are means $\pm$ S.E.M. of three separate experiments, each performed in duplicate.

Chart 1. Structures of previously described 2-amino-3-aroyl thiophene derivatives 1a-e, 2a and 3ab as allosteric modulators for the $\mathrm{A}_{1}$ adenosine receptor

1a (PD 81,723); $\mathrm{R}_{0}=3-\mathrm{CF}_{3}, \mathrm{R}_{4}=\mathrm{R}_{5}=\mathrm{CH}_{3}$
1b (LUF5484); $\mathrm{R}_{0}=3,4-\mathrm{Cl}_{2}, \mathrm{R}_{4}, \mathrm{R}_{5}=\left(\mathrm{CH}_{2}\right)_{4}$
1c (T62); $\mathrm{R}_{0}=4-\mathrm{Cl}, \mathrm{R}_{4}, \mathrm{R}_{3}=\left(\mathrm{CH}_{2}\right)_{4}$
1d (PD 71,605); $\mathrm{R}_{0}=3-\mathrm{Cl}, \mathrm{R}_{4}, \mathrm{R}_{5}=\left(\mathrm{CH}_{2}\right)_{4}$
1e; $\mathrm{R}_{0}=4-\mathrm{CH}_{3}, \mathrm{R}_{4}, \mathrm{R}_{5}=\left(\mathrm{CH}_{2}\right)_{4}$

2
$\mathrm{R}_{0}=4-\mathrm{Cl}$ or $3-\mathrm{CF}_{3}$
$\mathrm{R}_{1}=\mathrm{EWG}\left(\mathrm{F}, \mathrm{Cl}, \mathrm{CF}_{3}, \mathrm{NO}_{2}\right)$
or ERG ( Me or OMe )
$\mathrm{R}_{5}=\mathrm{H}, \mathrm{Me}, \mathrm{Et}, \mathrm{Br}$ or aryl
2a, $\mathrm{R}_{0}=4^{\prime}-\mathrm{Cl}, \mathrm{R}_{5}=4^{\prime}-\mathrm{Cl}-\mathrm{C}_{6} \mathrm{H}_{4}$

3
$\mathrm{R}_{0}=2^{\prime}-3^{\prime}-$ or $4^{\prime}-\mathrm{Cl}, 3^{\prime}, 4^{\prime}-\mathrm{Cl}_{2}, 3^{\prime}-\mathrm{CF}_{3}$ or $4^{\prime}-\mathrm{CH}_{3}$. $\mathrm{R}_{5}=\mathrm{H}, \mathrm{Br}$, heteroaryl (thiophene, furan, pyridine, pyrazole, isoxazole), phenyl with EWG (Cl or F) or ERG (alkyl, alkoxy or $\mathrm{OCF}_{3}$ ).
$\mathrm{X}=$ nothing or $-\mathrm{C}=\mathrm{C}$-.
3a, $\mathrm{R}_{0}=4^{\prime}-\mathrm{Cl}, \mathrm{X}=$ nothing, $\mathrm{R}_{5}=4^{\prime}-\mathrm{Cl}-\mathrm{C}_{6} \mathrm{H}_{4}$
3b, $\mathrm{R}_{0}=44^{\prime}-\mathrm{Cl}, \mathrm{X}=-\mathrm{C} \equiv \mathrm{C}-, \mathrm{R}_{5}=\mathrm{C}_{6} \mathrm{H}_{5}$

Chart 2. Structures of 2-amino-3-(p-chlorobenzoyl)-4.5-disubstituted thiophene derivatives 4a-af, and $\mathbf{5 a} \mathbf{a} \mathbf{i}$ evaluated in this study as allosteric ligands for the $\mathrm{A}_{1}$ adenosine receptor
